We feel ourselves compelled to call the attention of the public to the present condition and immediate prospects of the Church of St. Peter at Westminster: and this seems to us to be all the more necessary, because the public have scarcely understood the really important considerations which should be kept in mind in dealing with this piece of national property. The idea that is current in most people's minds seems to be that, apart from its function as a place of worship, it is to be used in some way or other as a kind of registration office for the names of men whom the present generation considers eminent in various capacities; the method of so registering them being the placing of a monument to their honour in the church and sometimes burying their corpses beneath the pavement. That this strange notion, which seems to have first taken root about the end of the seventeenth century, and was in full vigour all through the eighteenth and the earlier part of this century, is still alive in most men's minds, is clear from this fact, that now, when even the Dean and Chapter of Westminster have declared that burials in the Abbey must cease, and when it is clear to the most casual observer that the church is crowded to absurdity with specimens of the gravestone-cutter's art, the public still think that the corpses of notabilities should be buried and their memories noted, if not in the Abbey, yet at any rate in some building contiguous to it, which is, if possible, to make a pretence of being a part of it. The result of this feeling in the public has been that more than one scheme has been elaborated for providing space for this registration of notables in connection with the abbey; of which it may be said that the best of them seemed likely to do not much harm to the remains of the ancient abbey outside the church, and that the worst intended the actual destruction of part of the church itself by pulling down the wall of the north aisle in order to foist a nineteenth-century imitation of thirteenth-century architecture on to us as a part of the ancient building.

Moreover, it must be said that the ordinary visitor to the abbey goes there not to see the church but the monuments of all kinds that it contains, and the Dean and Chapter understand this so well that while they throw obstacles in the way of those who want to study the architecture they arrange for the following round of the monuments, mostly in the company of a showman after the fashion of Mrs. Jarley.

It must be said, furthermore, that the building suffers from

the neglect of the most ordinary measures for keeping it clean and neat, and though it is true that it is difficult to struggle with London filth, yet its worst evils might at least be minimised. If the revenues of the Chapter are insufficient for dealing with this disadvantage, a public subscription might be opened for the purpose.

We fear, therefore, that in following out this curious superstition of the two last centuries, that it is necessary that Westminster Abbey should serve the purpose of a "National Valhalla," the public have neglected all other uses to which this building might serve, except that of a place for the decent celebration of the services of the Church of England; and that they are careless of what damage the church may suffer so long as it fulfils these two offices. But this carelessness, as a matter of course, extends to the injury which Westminster Abbey may receive at the hands of those who do see another use for it, viz. the literal reconstruction of lost or damaged features of the architecture of its earlier life; the "restoration," as it has been called, of the art of a period very different from ours.

Externally at least this great church has, from one reason or another, suffered more from the seventeenth and eighteenth centuries than most others of its size and dignity; being situated in the centre of government of this country, it has not enjoyed the advantages of boorish neglect which have left so much of interest in Mediaeval buildings in remoter parts of the country. Every generation after the decay of living organic art has added its quota to the degradation of the building. Setting aside the destruction of furniture and decorations which, as a matter of course, took place under the two Puritan upheavals, and which was not so complete here as in some churches, the repairs or renewals done at different periods before our own, by men who had no sympathy with the original work, have been sufficiently disastrous to the exterior. The heavy hand of the academical classical architect has been more or less all over the building outside. The north transept, which in the time of Hollar, if one may judge from his curious nondescript engraving, was in a genuine condition, though possibly needing repair greatly, was reduced to the due commonplace ugliness which was then thought to be impressively respectable; the western towers omitted by the Mediaeval builders were supplied in the same style, having been probably designed by Wren and carried out by Hawksmoor, and remain in good condition as monuments of the incapacity of seventeenth and eighteenth-century architects to understand the work of their forefathers, and perhaps one might say that they furnish a wholesome lesson to future ages not to attempt the imitation of a past epoch of art. If the architect or architects of these towers had left the Gothic alone and had built the new towers in the queer style of driven-into-a-corner Classic, which is that of the City church towers of or about that date, they certainly would not have jarred our sense of congruity so much as the quasi-Gothic existing ones do, and also, which is a great point, they would not have been so ugly. Wren's "restoration" of the south clerestory also was to be seen a year or two ago. This had to do with the ornamental features of the windows, which were reduced to the Bible and Prayer Book style of the period, but left the main surface of the walling alone.

The beginning of the nineteenth century saw an important degradation in the rebuilding of the exterior of Henry VII.'s Chapel by Wyatt; the type of the architects of the first period of Gothic knowledge who were far more destructive than those of Gothic "ignorance," and, moreover, had no style of their own, and give us examples of the very extreme of academical lifelessness. Mr. Wyatt managed to take all the romance out of the exterior of this most romantic work of the late Middle Ages, and has left us little more than *caput mortuum*, an office study of the exterior of the chapel.

Blore began in 1809 the recasing of the north aisle of the church, a work which was finished by Gilbert Scott; the two between them completely destroyed all trace of the handiwork of the Mediaeval masons in this part of the church.

All these degradations belong to the time before the genuine "restoration" mania fell upon Westminster Abbey; they are well-meant, ill-conceived and disastrous pieces of repair of various degrees of stupidity, culminating in the last-mentioned wholesale destruction of the thirteenth-century masons' work.

Sir Gilbert (then Mr.) Scott was appointed architect of the abbey in 1849, by which time the second period of architectural Gothic "knowledge" had arrived. He "carefully restored" the chapter-house, that is, he made it (we are speaking of the exterior now), a modern building, imitating with about as much success as is possible in such cases the work of the thirteenth century. It has no longer any claim to be considered a work of art; it is the architect's architecture, the work of the office, in which the executants are in no degree taken into council.

The work of "restoring" the exterior of the church was carried on by Mr. Pearson (now living and still the architect of it). His work on the south side of the church is now pretty much complete, and is of the same quality as Sir Gilbert

Scott's. But not satisfied with the eighteenth-century transfiguration of the north transept (who could be?) and driven by the necessity of making some structural repairs, he carried on the idea of making a conjectural restoration of the north transept, which was begun by Sir G. Scott. This work has now been accomplished, and he who runs may read.

The result is most unsatisfactory. Admitting that the eighteenth-century work was in no way good as an independent work of architecture, it was nevertheless done by men who put some of their own thought into it, poor as that was; moreover, they had not learned how to forge thirteenth-century architecture, and they had retained the outline of the old work, so that between what the eighteenth century left and what it produced, it was of some historical value at least. Its artistic value chiefly lay in the fact that, owing to the action of wind and weather, the surface of it was not unpleasant; and altogether it was so little distracting that it was no bad preparation to the visitor for the solemn beauty of the interior of the church.

The work that has taken its place is, as it was bound to be, with such ideas leading its architects, another example of the dead-alive office work of the modern restoring architect, overflowing with surface knowledge of the Mediæval work in every detail, but devoid of historic sympathy and true historical knowledge, and with no other aim in view than imitating the inimitable. But this example of the error is made more palpable and absurd by the fact that it is an imitation of very ornate thirteenth-century work, including abundance of figure sculpture. Now we must remind our readers that the free carved ornament of the Middle Ages (whether of figures or not) was the handiwork of artists, and whatever their shortcomings might have been they were expected to and did express their own conceptions with their own hands; they were undoubtedly the best artists of their time for the work in hand; they belonged to no inferior rank of artists, that is, but were the leaders of their art; there were no artists above them doing work more intellectual and educated. Their productions, therefore, were always genuine works of art, whatever their relative merits might be.

Nor is that all; they were working under the full influence of traditions unbroken since the very first beginnings of art on this planet; they were entirely unable to feign themselves other than they were, artists of their own day: any real artist of the present time will at once be able to see what an advantage this was to them; that the bond of tradition was so far from being a fetter, that it left them truly free to give form to their thought according to their own wishes. Their works still speak for them, and show us what a great body of artists of the highest skill and sense of beauty was at work amidst the scanty populations of Mediæval Europe.

It is clear then that the Mediæval architect, master builder, abbot or whoever else planned the building, could never have been at a serious loss for skilful men to decorate his building according to the fashion of the time. Let us turn the page and see how it stands with us now in this matter. There are undoubtedly many clever sculptors (or modellers, rather, for they do not as a rule carve their own work) in civilised countries; but the capacity for designing and executing the subsidiary forms of carved ornament has completely departed from those countries on the one hand, while on the other the sculptors aforesaid are divorced from architectural or ornamental work, and most of them would consider themselves treated with less than due consideration if they were asked to undertake it. The few instances in which they have timidly attempted to get into some relation with architecture have had such poor results as clearly to show how difficult it is for them to produce any work which is not merely isolated and ornamental.

This is so obvious to the architects in need of carved work for their imitative restorations that they never even attempt to employ artists on their work; but a supply has sprung up to meet the demand, and workmen are employed to produce imitative Gothic sculpture in which they have no interest, and of the spirit of whose prototypes they have no understanding; the tangible result of this being what is called ecclesiastical sculpture—so utterly without life or interest that nobody who passes under the portal of the church on which it is plastered treats it as a work of art any more than he does the clergyman's surplice within the building.

The restoring architect is therefore in this dilemma, that what there is of skilful and original sculpture is not fit for his purpose, and will not make ornament; and that what he can have and which professes to be ornament has no artistic value. What is to be done in such a case? The common-sense view of it would be that he had better forego the ornament. But here he is met by the difficulty that he has set out to make a scientific imitation of, say, a French portal of the thirteenth century, and such portals always had sculpture of such and such subjects on them, so that his restoration will not be thorough unless he has the due amount of quasi-ornament to show. Therefore in the teeth of reason and logic he is compelled to accept the makeshift for the real thing, and as a consequence to leave his work bedizened rather than ornamented.

That this has necessarily been the case with the new front of the north transept at Westminster must be obvious to anyone who understands art, and in spite of all the knowledge and skill of the architects it could not have been otherwise, considering the point they started from. If any such person doubts this, let him compare the new imagery of the porches with the angels high up in the transept within, or let him look at any piece of genuine carving there and compare it with the subsidiary work in the porch, and he will surely see in every line of the first the vigour and pleasure of the hand of the workman, and in the other a joyless putty-like imitation that had better have been a plaster cast.

To sum up then the case of the outside of Westminster Abbey; a long series of blunders of various kinds, all based on a false estimate of the true value of the building, have damaged it so vitally that scarcely any of its original surface remains, and we have nothing left us but a mere outline, a ghost, so to say, of what it was. A great misfortune truly, and an irreparable one. What else is left us of the Abbey Church that is still so valuable that we are in a trouble of anxiety lest this also should be taken away from us?

In a few words the interior of the church is left to us; and this, while the exterior has suffered so grievously as to have been all but entirely destroyed, has been less damaged than many other great churches. In fact, were it not for the result of the mania for monuments, that as aforesaid has been so recklessly indulged in up to the present moment, the interior of the Abbey Church would be comparatively in a very good condition, and would leave little to be desired save the clearing away of the imitative and unoriginal stained-glass which has got into the windows at various times, to the great damage of the effect of the church. As to the monuments once more, the burden of their ugliness must be endured, at any rate until the folly of restoration has died out; for the greater part of them have been built into the fabric, and their removal would leave gaps, not so unsightly indeed as these stupid masses of marble, but tempting to the restorer, who would not be contented with merely patching them decently, but would make them excuses for further introduction of modern work. In short, disastrous and disgraceful as these pieces of undertakers' upholstery are, and though they make us a laughing-stock among nations for our folly in having permitted them to blemish the church, they protect us from the still greater disaster of the platitudinising of the whole interior by a "thorough restoration."

It is the rumour of the contemplation of this "thorough restoration" which makes this memorandum of our Society necessary, and we shall have presently to recur to it, but we must first write a few words of recapitulation and of definite explanation of the position of our Society in regard to this matter.

We have stated that amidst the neglect of the general public which Westminster Abbey lies under there are two views taken of it. The first that it is a convenient receptacle for the monuments of the notorieties that rise up, wax, wane and set from time to time.

The second that it is a good piece for the exercise and exhibition of the skill of the modern architect, and his scientific knowledge of the methods of design and building of the Middle Ages, which is so complete that it enables him to surmount at one stride the difficulties created by the long lapse of years, and the complete change in ideas and the structure of society which it has brought about—that in short Westminster Abbey can be renewed in our time, and that, being renewed, it will be the same Westminster Abbey which the eyes of Chaucer beheld when he was yet in the flesh.

Those, we say, are two views. Is there no third? Yes, there is the view of this Society, which can be stated easily and shortly. It is this. Westminster Abbey, in spite of all injuries, is a great work of art, valuable to all succeeding generations as long as it holds together, and it can by patience, pains and good judgment be held together for an indefinite time. Moreover, the art of it is inextricably interwoven with the history which has, in fact, produced it. It may seem strange to some that whereas we can give some distinguished name as the author of almost every injury it has received, the authors of this great epic itself have left no names behind them. For indeed it is the work of no one man, but of the people of South-Eastern England, working in the manner which the traditions of the ages forced upon them. And that is the reason why we must accept as irreparable those injuries which it has received, and which we lament so much. It was the work of the inseparable will of a body of men, who worked as they lived, because they could do no otherwise, and unless you can bring those men back from the dead you cannot "restore" one verse of their epic. Rewrite the lost trilogies of Æschylus, put a beginning and an end to the fight at Finsbury, finish the squire's tale for Chaucer, even if you cannot

Bring back him who left untold
The story of Cambuscan bold,

and if you can succeed in that, you may then "restore" Westminster Abbey.

But though you cannot restore it, you can preserve it. And we must tell you that to do less than this is to involve yourselves in a great national stupidity, a national crime in fact. For this at least you can do, whatever the condition of the arts among us may be. Care and common sense will enable you to do that without the expenditure of any great faculty for the production of art.

Lastly, if we are asked if it be worth while to take this trouble, and what is the importance of this piece of architecture as architecture, or what rank Westminster Abbey takes as a work of art, we can only say that, setting aside all the glamour which history and tradition have cast over it, it is a building second to none amongst all the marvels of architectural beauty produced by the Middle Ages. Like all such buildings, its beauty is convincing, and sets criticism aside. And the man who is not moved by it must have resigned the human faculty of letting his eyes convey ideas to his brain.

We must now mention the rumour of "restoration" of the interior which has alarmed us. Something is certainly in contemplation, but what it is, whether it be needful repair or destructive restoration, we cannot tell you. And this for a very definite reason. Having, in common with the rest of the public, heard the rumour, we thought that we were bound by our position before the public to refuse to accept mere hearsay, and to obtain definite, detailed, reliable information from the delegated guardians of the abbey, the Dean and Chapter. We wrote to that body, then, simply as a part of the public that wished for information, and we were met by a refusal to give any information. We must suppose, because the Dean and Chapter misunderstood us, and though we considered them responsible to us, and not to the public at large, as we certainly do consider them. We can only express a hope that they will tell the public what they intend doing with what is really, if not legally, a piece of national property as speedily and as directly as they can.

It is in this hope that we have delayed calling public attention to the matter for so long; but we feel that it will not admit of indefinite delay, and accordingly put our views before the public.

If we are asked what should be done, our reply is very simple. We believe that one architect, however distinguished and learned, is too heavily burdened by having the sole charge of the abbey in his hands. We think that a consultation should be called of the best practical architects, builders and engineers, and that they should report as to the stability of the fabric, and what means should be taken to render it thoroughly secure; and, a satisfactory scheme having been agreed on, funds should be obtained from Parliament, or if that were not possible, by subscription from the public at large, for carrying it out without delay. But we are also sure that such a scheme should disclaim most emphatically any intention of meddling with the ornamental features of the building.

The structural stability having been secured, the Abbey should be kept clean; and otherwise not be touched at all. That is the only thing to do, and there is no second course which would not lead to fresh disaster. Let bygones be bygones, but do not let us enter on a second series of alterations and improvements which will deprive us at last of all that is now left us of our most beautiful building.

TESSERÆ.

Poetry and Painting.

WHATEVER art can do, it can do not only well but perfectly, and that which it can do best it can do better than the same thing can be done by any other expressive power. But while the poet, with all his range, can never bring the Madonna before the sense, as Raphael has, the painter cannot make the language of visible objects embody the ideas of spiritual or mysterious agency. How shall the painter, for instance, with any resources at his command, give shape to that image, before whose awful presence, as conjured up by the sublime poetry of Scripture language, the heart stands still: "Then a spirit passed before my face; the hair of my flesh stood up: it stood still, but I could not discern the form thereof: an image was before mine eyes, there was silence?" What bold brush could undertake to make intelligible to the sense—what language yet bring vividly before the mind—the burning bush as it appeared to Moses on the Mount? as what mortal music dare seek to utter the "still small voice" that followed it? In fact, this very power of language to do much that the arts generally cannot express, furnishes at once an excellent measure of the controlling power of the imitative principle in the arts, and an indication of the uses to which imitation for the high purposes of art should be devoted. Just because language is the least imitative of all the arts, it is by far the most suggestive. Language can suggest everything that the mind is capable of receiving, from the very fact of its being in no way limited to

the actual sensible resemblance of things, while all the suggestions of art must arise out of the sensible objects which it presents. That art, then, is the highest, which, true to the principles of imitation, rightly understood, that lies at its base, enlarges and spiritualises such imitation by the greatest amount of suggestive thought, but bears in mind, at the same time, that the range of thought must be controlled by the capacity for its suggestion, residing in the imitative language which it is compelled to employ. For this reason it is that all of the numerous art attempts at the personification of the Almighty, under the form of an aged man, are, and must be, by the very conditions of the case, lamentable failures. The supreme and concentrated image of Power and Eternity is here sought to be rendered in forms that suggest the ideas of imbecility, decay and death. Raphael, himself, in his treatment of the Creation, has represented only a venerable old man, toiling and struggling with exaggerated action among rolling clouds. The comparatively unspiritual deities of classic lore were, for the same reasons, fit enough themes for the handling of classic art. The Greek Mythology, which invested the gods with human passions, consistently adopted human forms for their expression, and had thus possible types which these artists might exalt by treatment, instead of the spiritual God whom the noblest treatment must yet lower to the human type. And thus it is that the Greek sculptor could assist the Greek poet in the establishment of certain personifications, composed of distinct and varying attributes, which had all a human reference, but, in their concentration and emphasis, were in each case sublimed by art and poetry into a classic god.

The Essential in Greek Sculpture.

Disciplined observation led the Greek sculptor in his search after the representation of beauty, strength, grace and other attributes, to seize on the characteristic details as he found them in a number of human objects, and these combined into one whole gave the ideal of the type. These sculptured figures now known under the denomination of the antique—while they form the studies for his imitation and examples, at the same time invest the student's mind with ideals of certain attributes and teach him, when in turn he looks to Nature for his models, to detect and estimate the accidents or departure from the beauty of proportion of form or of character with which he must constantly meet in the living example through which he may seek to embody his own conceptions. In the whole range of antique sculpture, with the single exception of what is named the Torso, there are no examples so worthy of consideration as the fragments of art known as the Elgin Marbles. Before their discovery we were obliged to content ourselves either with such treatments of the human figure as are supplied in the eminently conventional forms of the Apollo Belvedere and other embodiments of superhuman character, wherein the departure from fact was intentional and in accordance with the mythological theme to be realised, or with such examples as were presented by the athletic figures of the Fighting and the Dying Gladiators—fine specimens of ordinary nature, and adequate exponents of the ideal of their class. In the mean betwixt these two orders of description—the ideal and the actual—the highly conventional and the literal, we have now in the bodies of the Theseus and the Ilyssus the exact treatment that defines the limits of the essential and accidental—clothing the essential meaning in forms sufficient and best fitted for its expression, controlling detail by knowledge and judgment of the abstract. No particulars are wanting that help the sentiment of action in the one or that of repose in the other of these fragments, while facts so minute as the foldings of the skin are rendered with a truth which, having the moral coefficients so largely expressed, but add their mite to the sum of the imitation. Close study of such examples, as well as of the human and animal forms in the frieze of the Parthenon, will train eyes and understandings for the due estimation of similar objects in nature. No unessential or redundant particulars were permitted to enter into their representation. Wherever in the works of these old Greek masters exaggeration of natural circumstances occurs, it must be accepted as an intentional deviation for a purpose foreign to the theme itself—as a calculation for the efficient expression of the parts, when removed, for instance, to such a distance from the eye as was implied in the place of their original destination.

Phrenology and Art Critics.

Every spectator sees a picture in his own way, and he perceives its different elements with a degree of vivacity and interest corresponding to the development and cultivation of his own mental qualities. The individual who has a low quality of brain and a small development of the organs of form, colouring and ideality, will be little affected by beautiful forms and colouring or even by fine expression; but if he have much individuality and imitation; he may be greatly gratified by minute and successful representations of objects with which he is familiar. If another have large organs of ideality, casuality

and comparison, with a high temperament, but be deficient in individuality and imitation, he may despise imitation as an object of art, and demand grand general ideas, expressed in corresponding forms and colours. A spectator in whom any organ or group of organs is large will recognise and feel interested in the natural language of the corresponding faculties, as it is expressed in the face and attitudes of the figures. Hence men in whom the base of the brain, the intellectual organs, and those of ideality are large, and the coronal region deficient, sympathise with and delight in what they call the fine, vigorous, manly characters of pirates, banditti, boors and outlaws; they are interested also by pictures representing tortures, slayings, and other horrors of human action and suffering, while the truest, most lively, and (to differently constituted men) most captivating expression of the moral sentiments appears to them comparatively flat, stale and unprofitable. If this combination of the organs of the propensities and sentiments be reversed in the spectator, the latter qualities will challenge all his sympathies, while he will turn away with aversion from the former representations. He will possess a tact or instinct by which he will recognise and appreciate certain moral characteristics in living man and in pictures and statuary, to which an individual deficient in the coronal region will be nearly blind. The latter may see them, because he possesses the moral organs to some extent, but his mental sympathies will be as limited as his cerebral development, and his interest will be low in proportion to it. The same remarks may be applied to the individual organs. Each acts spontaneously when representations of its own objects are presented to it, and then it gives rise to its own emotions and impressions. When the impressions are agreeable we call the objects beautiful, when disagreeable we condemn them as plain or ugly, and when indifferent we call them insipid. Hence most persons have some instinctive taste for the fine arts, but it is obvious how each should form a judgment concerning them in some degree peculiar to himself, corresponding to his own special combination of organs and his opportunities of mental cultivation.

Wages at Westminster, A.D. 1291-92.

The rolls furnish interesting information concerning the rate of wages of artificers at the close of the thirteenth century. We learn that the superior masons who were engaged in the years 1291 and 1292 had 6*d.* a day, and that the wages of the others varied from 4*d.* to 4½*d.* and 5*d.* a day; the weekly wages of the apparitor, or foreman, were 3*s.* 6*d.*; the squarers of stone and their assistants were paid from 4*d.* to 5*d.* a day. Wages of the principal smith, 6*d.* a day; of carpenters, from 4½*d.* to 5*d.* a day; of plumbers, 4½*d.* to 6*d.* a day; of tilers, 5*d.* a day. The wages of the painters in those years were as follow:—Master Walter, the principal painter, was paid 14*d.* a day, the others smaller sums, in general from 7*d.* to 3*d.* a day. Two individuals, Andrew (Andrea) and Giletto, probably Italians, had conjointly 6*s.* 8*d.* for six days, and 8*s.* in another week for the same time. Among the articles charged in these accounts are several which clearly demonstrate that painting in oil-colours formed a part of the decorations that were then in progress. Oil and cole and varnish, with white and red lead, vermilion and azure, and sinople are repeatedly mentioned, together with gold and silver (leaf), of which considerable quantities were used. These articles, as Mr. Hawkins has remarked, "could not have been wanted for mere house-painting"; and hence, as well as from the length of time which the artists were employed, he judiciously infers "that the paintings were not even heraldic bearings (exclusively), but human figures; either portraits or ideal representations, and historical subjects, such as were afterwards painted on the walls when the chapel was rebuilt by Edward the Third." From the prices mentioned in the rolls it appears that a "pottle of oil" cost 5*d.* or 6*d.*, a pound of red lead 2*d.*, a pound of white lead 1½*d.* or 1¾*d.*, a pound of tin 3½*d.*, a quarter of azure 1*s.*, a pound of red varnish 3½*d.* and 4*d.*, a quarter of sinople 1*s.*, a pound of green 5½*d.*, 100 (probably books) of gold-leaf 3*s.* 4*d.*, 100 of silver-leaf 6*d.*, and a quarter of vermilion (probably of a hundredweight) 6*s.* 5*d.*

The Inventions of Sir M. I. Brunel.

The circular saw and slide-rest form part of Brunel's series of machines, and he afterwards constructed the former on a very great scale for the manufacture of wooden veneers. To them he added the mortising machine, and these, it will be seen (together with the planing engine), form the staple of the magnificent and varied apparatus with which, driven by the gigantic power of steam, our mechanical factories are now so generally provided. Everyone is, however, aware that Brunel owed his reputation to other achievements as well as his improvements of mechanical tools. The Thames Tunnel will ever be considered as his most arduous triumph. It is a structure of exquisite firmness laid in a quicksand. It will endure like the *cloaca* of regal Rome, when the palace and the cathedral have crumbled

to dust. Yet here also we perceive that it was Brunel's exquisite mechanical tact and ingenuity which enabled him to succeed. The problem of the tunnel is not one of balancing vaults; the static conditions of stability are simple enough, and it was not in the solution of such that Brunel peculiarly excelled. The practical problem was to introduce a rigid tube of brick horizontally into the middle of a quaking mass of mud, and the solution was the invention of a tool which should enable men to make the excavation and to proceed with the building in safety. It was the shield which carried the tunnel under the Thames—a movable vertical frame of cast-iron, provided with thirty-six cells, in each of which a man was placed with a pick to excavate the area required for the construction of the tunnel. By a simple but most ingenious contrivance, every part of the face of unstable clay was firmly supported by boards which leaned upon the frame or shield, which, in its turn, pressed against the part of the brickwork of the tunnel already completed. Each workman could remove one or more of these small boards at pleasure, and excavate a short way into the yielding mass before him, then advance the boards and sustain the slippery face. When the whole face had thus undergone piecemeal excavation, the frame or shield was moved bodily forwards by powerful screws, and the bricklayers brought up the masonry behind, which was then beyond the reach of injury. The idea of the shield was derived, it is stated, from a specimen in the arsenal at Chatham, showing the operations of a testaceous worm which bores under water, and which nature has provided with a protective covering. But the analogy is certainly indirect, since water could hardly retard the operations of such an animal. Repeated irruptions of the Thames several times drowned the work, which was as often abandoned and renewed, but every difficulty was met by fresh resources on the part of the engineer. The failure of funds was a far more serious obstacle, and Government at last came to the aid of an undertaking of such consummate ingenuity that its completion was deemed due to the honour of the nation. The tunnel was commenced on March 2, 1825, and finished March 25, 1843. Brunel survived the completion of his great work above six years, dying on December 12, 1849, aged eighty-one. Scarcely any branch of his multiform profession but received some improvement at his hand. The discovery of the condensation of several gases in 1823, by Mr. Faraday, suggested to Brunel their application as a moving power, and his want of success did not arise from any deficiency on his part of skill or forethought. He was one of the first to construct a roof of extreme lightness, somewhat resembling those now in use for railway stations. He erected a suspension bridge in the Isle of Bourbon on an original plan; and he pointed out with characteristic shrewdness how much of the stability of arches depends upon the cohesion of the parts, so that the vault may in some cases be entirely dispensed with.

Thirteenth-Century Thoroughness.

One thing cannot fail to strike everyone who closely studies our old architecture. In early Norman buildings we often find rude and clumsy workmanship; in works from the middle of the fourteenth century on to the extinction of Gothic architecture we frequently meet with the same—the work of rude untutored hands evidently unable to do justice to their style. But from about 1175 to the end of the thirteenth century and a little later, we scarcely ever meet with this inequality. The art seemed to be all-pervading. Certain buildings may have been plain to a degree and rustic in their object and material, yet you rarely find anything you can call rude in workmanship or unskilful in treatment. It was a great period, and its greatness seemed to pervade even the most secluded districts, and the workmen everywhere to have felt a pride in keeping up the period of their art in which their lot had been cast. Nor need we wonder at this, for everywhere were buildings going on; scarcely a village church escaped the notice of the builders of this wonderful age. The whole country was engaged in the one work of building, and that with an ardent feeling to render their work worthy of the style they had generated. And let us not imagine that the architecture of the age developed itself only in building cathedrals, abbeys or churches of any kind; all other buildings evince the same spirit: a barn of the thirteenth century shows the nobleness of the pervading style as clearly as even the cathedral itself, and what remains of their domestic architecture tells the same tale. Everything was done well, in good taste, and in accordance with reasonable and practicable requirements and the means at command. Nor was it to architecture alone that the arts of the period were devoted: we find the same art expended on stained glass, on metal-work of all sorts, on enamels of the most magnificent character, on the illumination of manuscripts, the painted decoration of the buildings, on jewellery, on ivory-carving, on embroidery, on woven fabrics, tapestry, seal-engraving—in fact on every branch of decoration; every one of which arts were carried out with a degree of skill and instructive taste that was truly amazing.

NOTES AND COMMENTS.

It is not often a claim for commission is heard in the courts that has the novelty which was found in the case *LUCAS v. GABRIEL*, which was tried before Mr. Justice COLLINS a few days ago. The action really arose out of a set of plans for which neither plaintiff nor defendant could be held responsible, and which related to a big building in Dalston known as the North London Colosseum. It was used for a circus and other purposes, but the County Council insisted on alterations which would cost 3,000*l.* and for which Mr. VERITY prepared plans. As a consequence the property was to be sold. The plaintiff put the venture before the defendant, who said he would pay 1,000*l.* if the freehold was obtained for 5,250*l.*, the leasehold interest for 6,250*l.* and a tenant was discovered who would pay 1,200*l.* a year rent and expend the 3,000*l.* on alterations. Mr. LUCAS was fortunate enough to realise all that was proposed, and he received 33*l.* on account, the defendant agreeing to pay a similar sum when 1,000*l.* had been expended on the works, and the balance when they were completed. The incoming tenant also entrusted Mr. LUCAS with the carrying out of the alterations as contractor. For that purpose Mr. GABRIEL handed him some plans which had been received from the vendors, and which were supposed to be those prepared by Mr. VERITY and sanctioned by the County Council. The alterations were commenced. One day the tenant's architect appeared on the scene and declared that what was being done could not be in accordance with the official regulations, and that there was some mistake. As it turned out, the plans did not correspond with those which were sanctioned. The works were suspended pending the preparation of proper plans. The tenant grew alarmed about the delay, and claimed the sum deposited; the defendant, on the other hand, sought to have the agreement carried out. Finally, the dispute was compromised, the tenant received most of the money he paid, and his tenancy was cancelled. Mr. LUCAS claimed his 66*l.* as balance of his commission, and charged the defendant with non-supply of the proper plans, taking possession of the building and compromising the action with the tenant. Mr. JUSTICE COLLINS held that the money was not due, as the alterations were not carried out; that the tenant could have obtained tracings of the sanctioned plans, and there was no default on the part of the defendant; that the lease provided for owner's re-entry, and there was no breach of action in the compromise. Judgment was therefore given for defendant. The case shows how easily one agreement can nullify another, although both have the same intention. If the plaintiff held to the original verbal agreement it could not be set aside, but by accepting a later one, in which the time for paying the instalments was defined and the agreement was made to appear conditional, he lost his action.

EXPERIMENTS were lately undertaken at Sibley College, which forms part of the American Cornell University, to ascertain the extent of the loss of heat by radiation from the steam-pipes employed for warming the buildings. There are about 150 feet of 10-inch and 2,050 feet of 6-inch pipe, all laid underground. The piping is protected by placing it within rings, formed by boring out sections of logs, the holes being large enough to leave an air-space of nearly 1 inch around the pipe. The thickness of the wood is 4 inches. The outside of the wooden pipe is wound spirally with hoop-iron and coated with hot coal-tar and sawdust. Measurements showed that pipes protected in this manner lost only about 31 per cent. as much heat as those uncovered. Another series of tests were made at South Plainfield, where a number of engines at different points are supplied with steam from a single boiler plant through 747 feet of 4, 5 and 6-inch pipe. This was placed in a covering consisting of two concentric octagonal pipes, each built of 1-inch plank, and separated from each other by a very thick layer of waterproof paper. The steam-pipe passes through the centre of the wooden pipe, and is surrounded by a half-inch air-space. On account of the wet soil and the difficulty in securing proper drainage, the pipe was left on the surface of the ground and protected by a rough box of 2-inch plank. The experiments showed that this covering reduced the loss of heat to about 8 per cent.

of what it would have been with naked pipe. These figures are considered to show that it might be found economical, in cases where comparatively small quantities of steam are to be used in different places not too far distant from each other, to employ a central boiler plant and transmit the steam through protected pipe. It is without doubt possible to generate steam more cheaply in a single large plant than in a number of smaller ones, and if it can be demonstrated that the loss in transmission through covered pipes can be reduced to less than that involved by shafting, belting or electric motors, a strong argument in favour of the system is apparent.

THE hopelessly ignorant condition of the average country health-board in America is shown in a recent report of the Connecticut State Board of Health, quoted in the *Engineering Record*. The State Board had occasion to try to find out something about the way in which sewage was disposed of in the various towns, and accordingly addressed inquiries to the local health boards, with the results that might have been expected. One official reported that the sewage in his town was mostly "fed to pigs"; while, in another, it was "either spread broadcast on gardens" or allowed to run into "a low spot," "for the hens to drink." A third health officer gave the valuable information that "there is no sewage in town;" and a fourth found that in his district there was "no sewage to dispose of." Another reported that "nature took care of" the sewage in his town, and several described their systems of sewage disposal as "natural," or as "the ordinary method;" while one went into particulars about the "ordinary method," by explaining that the sewage is "washed away by the rains."

THE prizes which are annually given to young French artists have been again divided between exhibitors in the Salon and in the galleries of the Champ de Mars. There were seven competitors for the Prix de Paris, viz. three painters and four sculptors. Out of the thirty-seven members of the Conseil des Beaux-Arts who were present thirty-three voted in favour of M. MAURICE ORANGE, whose painting, *The Defence of Saragossa*, in the Salon, has been awarded a medal of the second class. Three "bourses de voyage" have been given in the sections of painting, sculpture and architecture, and one in engraving. The fortunate architects are MM. EDOUARD BAUHAIN, JULES GODEFOY and PAUL NORMAND, who are exhibitors in the Salon.

THE memory of the late FRIEDRICH SCHMIDT, who was for many years accepted as the leading architect of Vienna, is not to pass away as quickly as is common with artists of his class, as there is to be a memorial of him erected in the city he adorned. SCHMIDT's pupil and associate, Professor DEININGER, has agreed to be responsible for the architectural part, and a competition was opened to obtain models for the statue. There were thirty-two sent in. The first premium has been awarded to Herr HOFFMANN, the second to Herr SEIFERT and the third to Herr CHARLEMONT. Professor DEININGER in his architectural details has endeavoured to suggest that peculiar treatment of Gothic with which SCHMIDT's name is associated, and which seemed to be better adapted for cast-iron than for masonry. The only obstacle to the realisation of the design is the want of money, for so many memorials are projected the Austrians say they cannot pay for all.

WE have received a prospectus of the Photographic Salon to be held at the Dudley Gallery in October next. The exhibition is to be devoted exclusively to pictorial photography as opposed to the customary arrangements of a mixture of mechanical apparatus or scientific exhibits, with such illustrations as belong to a picture class pure and simple. The committee formed to carry out this object include the leading exhibiting photographers, both professional and amateur, in the United Kingdom, as well as representative workers in pictorial photography abroad. One aim of the exhibition is to remove the misconceptions and unjust prejudices which exist as to the power of photography to make artistic representations.

ILLUSTRATIONS.

NEW RESIDENCE, WOKINGHAM.

THE residence which forms one of our illustrations to-day is in course of erection for Mr. H. B. BLANDY, on an elevated site near Wokingham, Berks. The facing bricks are of a deep-red tint, specially selected from Messrs. LAWRENCE & SON'S kiln at Bracknell, with ornamental tile-hanging and moulded-brick cornices, &c., to first floor, and half-timber oak-work in gables filled in with thin bricks laid to pattern. Dark tiles are used for roofing. The contractors are Messrs. BOTTRILL & SON, Reading, and the architect Mr. GEO. W. WEBB, F.R.I.B.A., Market Place Chambers, Reading.

SHOP AND DWELLING, TOTTENHAM COURT ROAD.

THIS house has been erected for Mr. JAMES ELMY, china and glass merchant, at the corner of University Street. The materials of the front are red brick and Douling stone. The site is about 48 feet by 19 feet 3 inches, the basement used for warehousing extending 12 feet in addition to these dimensions. The contract for the building was 2,300/., and for the vaults under street 515/., and the total cost is about 3,000/.. The architect is Mr. FREDERICK WALLEN, of Gower Street, and the builders Messrs. TITMAS & SONS, of Grafton Street.

RESIDENCE, LICHFIELD ROAD, EBDINGTON.

THIS residence is now being erected for Dr. ASPINALL by Messrs. BISHOP & CHARLES, builders, of King's Heath, near Birmingham. The elevations are being carried out with light-coloured red bricks and red Hollington stone dressings; the ornamental brickwork and quoins are of cherry red Bracknell rubber bricks, and the roofs are covered with brown brindled tiles. The work is being carried out from the designs and under the superintendence of Messrs. ESSEX, NICOL & GOODMAN, architects, of Birmingham and London.

AUGSBURG.

TYTTENHANGER HOUSE.*

THIS interesting house, which by courteous permission we have the pleasure of visiting, has attractive historical associations. Its predecessor, as is well known, was a favourite residence of the Abbots of St. Alban. The manor was one of their earliest acquisitions. On this Mediaeval portion of our subject I have to offer a few prefatory notes.

At some period before the Norman Conquest a certain religious matron, Thurefleda, gave this estate to St. Albans ("in perpetual alms"). In the record (Cott. MS. Nero D. vii. fol. 90) it is called *Scenlea* (Shenley), i.e. land in Shenley. Also in the Domesday Survey it is described as if it were part of the Manor of Shenley:—"The Abbot holds Scenlea—it is rated at six hides—in demesne are two hides." The other portion of Shenley, clearly the principal manor, is rated at eight hides, and was held by Geoffrey de Mandeville. That the Abbey Manor in Shenley is identical with Tyttenhanger is a matter of inference. In the charter of Henry III., and subsequent charters cited in the confirmation charter of Edward IV., Shenley is not found; Tyttenhanger (Tidehangra) is found, and in the enumeration of the manors the latter seems to take the place of the former. For the correctness of this identity we may trust the county historians. The manor is situated in the parish of Ridge, and, according to my information, is nearly co-extensive with it. This is of a peculiar shape, being (according to Mr. Cussans's description) a long strip of land, about three-quarters of a mile wide on the average, and extending nearly ten miles north and south, the southern limit bordering on Dyrham Park, wedged in, as it were, between the parishes of North and South Mymms on the east and Shenley on the west. This is rather suggestive of the idea that it once formed part of the parish of Shenley, and was afterwards detached. At the time of the Domesday Survey the church of Ridge may have been a chapelry to Shenley, as we found Flamstead had been originally a chapelry to Redbourn. Sandridge was also once a chapelry. At what period Ridge became a parish cannot be known; its name does not appear in the abbey annals till the fifteenth century. No rectory is known; the rectorial tithes were held by the abbots, and were appropriated, probably at a very early period, to the office of the almoner. The almoner's tithes in Tyttenhanger were leased out by Abbot Robert

Catton in 1538 (Mr. Cussans quotes the document). These afterwards came to the Crown. "Tyttenhangre" was certainly an early appellation of the manor, probably in Saxon times. What does the name mean? The county historians give us no help. I will offer a suggestion. In the charters it is spelt Tidehangra. In the Book of Benefactors it is Tytynghangre. The last part of the word is clear. Hanger is an old name for a hanging wood, i.e. a wood growing on a declivity. Such woods exist still round about Ridge (Rugge), which, as the name denotes, is the high land of the manor. The level near Ridge Church is about 400 feet above the sea, according to the Ordnance Survey. Other hangers forming place names are Pans-hanger, near Hertford (probably Paynes-hanger (Payne being a personal name); and Osten-hanger in Kent. There are also some other instances in Norfolk. But what is the first part of the word? I believe it is tithes or tithing (tything). Tide-hangra and Tytyng-hangre are almost identical with Tithe-hanger and Tything-hanger, the former resulting from a rapid pronunciation of the latter. Thus the name would signify the tithes hanging-wood, or the tything wood. We may compare such names as Tithe-cote (the tithes cottage) in Devonshire, and Titherby (the tithes dwelling) in Nottinghamshire. What such a wood had to do with the tithes or tything I will not undertake to explain.

One feature of the lord's demesne, located here in the northern part of the manor, is the extensive moorland or heath. The name "Colney Heath," signifying "the heath of the Coln island," intimates its marshy character; it is still subject to floods. The abundant supply of water for forming fishponds was one of the advantages which attracted the notice of the abbots to this spot; others were the fertility of the soil, the richness of the pastures and the beauty of the woods. For these reasons, it is stated, Abbot John Moot designed to erect here a spacious country residence about A.D. 1400. Some of his predecessors had shown a special partiality for Tyttenhanger. Abbot Hugh de Eversden acquired about 100 acres here from John de Rammesden before 1326 ("Gest. Abb." ii. 122). Abbot Richard de Walyngford rebuilt the manor house about 1335. His successor, Abbot Michael de Mentmore, when spending his leisure here, found himself invaded by flocks of visitors, owing to the proximity of his residence to the high road to the north (the ancient pack-horse road which passed near). Consequently he removed to the manor house of Bradeway, which he put in repair, with the chapel (Mr. Cussans conjectures this to be another name for Maudelyns, in the parish of Northchurch, where the ruins of the chapel still remain). The abbot then demolished Tyttenhanger and sold the materials, c. 1340 ("Gest. Abb." ii. 371). The house seems to have risen again soon after, for Abbot Thomas de la Mare lodged here in 1350, on his return from Rome and before his instalment in the Abbey Church. The annalist reckons it among the faults of this abbot that he allowed this manor house to fall into decay. His successor, Abbot John Moot (as I have already stated) commenced the erection of a mansion on a larger scale and perhaps on a new site, suitable for the accommodation of his retinue and guests. He had previously erected two granges here. Part of the old house was habitable till his death in 1401, for the abbot was here in his last illness, and was removed in a litter to die in the monastery. He had done little more than lay the foundations, on which he expended 60/. Abbot William Heyworth continued the work, and completed it in six years, about 1408. The chronicler states that it was reputed to be the finest monastic country residence in the kingdom. We may suppose it to have been constructed of flint and Totternhoe stone; the precinct was enclosed by a moat. The moat appears to have been filled up about the beginning of the present century (Brayley). Its existence is now forgotten. Abbot Heyworth stocked the fishponds. His successor, John of Wheathampstead, added to the fame of the mansion. In his first abbacy he enlarged the chapel and inserted stained-glass windows, which cost 16/., (perhaps equivalent to 200/., in present money). Wever informs us (on the authority of a destroyed MS.) that on the walls, perhaps the wainscot, "he caused to be painted the similitudes of all the saints of his own Christian name John, with his own picture, which seemingly thus prayeth":—

Cum fero par nomen, par ferre precor simul omen;
Tum paribusque pari, licet impar, luce locari.

He also repaired the study, wherein, says Wever, he inscribed verses. A considerable portion of the ancient wainscotting is to be seen in the present house.

The abbot transacted a good deal of business here in his leisure hours. In 1462, July 3, he signed a presentation to the vicarage of Rudge (Ridge), having collated James Waleys, chaplain, on the recommendation of Henry Frowyk, Esq.; the previous vicar, John Bernard, had been indicted for treason, and taken to flight (Regist. J. W. ii. 12). This was during the Wars of the Roses. In 1429 he brought to a happy termination a controversy with a powerful neighbour about the manor rights. Thomas Knollys, lord of the manor of North Mymms,

* A paper by the Rev. H. Fowler, read at Tyttenhanger House on the occasion of the visit of the St. Albans Antiquarian Society, and published in the *Herts Advertiser*.

had long claimed to exercise in alternate years the right called "the indrove of cattle" on Colney Heath (otherwise called Tyttenhanger Heath). The indrove was the driving of the cattle grazing on the common into the manor pound, for the purpose of ascertaining whether any of the owners were subject to a fine on account of their not having grazing rights. The claim seriously affected the abbot's prerogative, but he had an object in view for which he thought it worth while to make some sacrifice. Accordingly at an interview held here he offered Knollys a compromise. His speech was a very polite one; the business part of it was to this effect:—"Sir, I will concede your claims and also allow you to enclose ten acres of wood, called 'Le Hoke,' provided you will make no opposition to my enclosing thirty acres of the heath; I refer to that angular plot which adjoins the grove which we call 'Conynghe,' opposite to my mansion." The offer was accepted, the indenture, which contained other minor stipulations, was drawn up and signed in the chapter-house of the abbey, April 1, 1430. The abbot's purpose was to form a deer-park, which he now effected after removing his tenants out of the enclosure ("Amundesham," i. 260). His satisfaction was expressed in a poetic effusion which we may entitle, "The Delights of Rural Seclusion at Tyttenhanger." The limits of the deer-park on the north-west appear to be marked by a place which retains the name of Park Gate Corner. In 1470 Abbot William Albone, while staying here, presented to the vicarage of St. Margaret de Rudge Thomas Thikthorpe, chaplain, October 12. His successor, William Walyngford, was frequently in residence, and signed many documents here—marriage licenses, grants of presentations, and various monastic appointments, e.g. the grant to Lord William Hastings to be seneschal of the abbey, dated "at our usual residence of Tyttenhanger, December 20, 1479." In July 1478 the abbot entertained here for six days the Papal collector, Master John Giglis, with his chaplain and six attendants; his visit was one of recreation (Regist. ii. 211). After this the monastic annals fail to afford information, with the one meagre exception of a record of rental of lands acquired (here) by Abbot Ramryge, in 1506, viz.:—"From Robert Nycols, for five crofts of land and the wood called Priors, and two crofts called Mylgrove, and two lofts called Pagys in Ruge, lately belonging to Thomas Deyer, 16s. 8d.; also rent of a tenement and lands in Ruge, lately John Ashleye's, 21s. ("Amund." ii. 251).

The last incident I can discover of monastic times, which is one of some interest, occurred in 1528, the 20th Henry VIII. For this we are indebted to Holinshed's chronicles. The narrative is as follows:—"In the end of Maie began in the cite of London the disease called the Sweating Sickenesse, which afterwards infected all parts of the realme, and slue manie within five or six houres after they sickened. This sicknesse for the manner of taking the patients was an occasion of remembrement that great sweat which raged in the reign of this King's grandfather; and happile men caused the same remedie then used to be reniued. By reason of this sicknesse the tearme was adjourned, and the circuit of the Assizes also. There died diverse of the Court of this sicknesse. . . . The King for a space removed almost every daie till he came to Tintinhanger, a place of the Abbot of Saint Albans, and there he with the Quaene and a small companie about them remained till the sicknesse was past." The queen at this time was the ill-used Catharine of Aragon; the abbot was Cardinal Wolsey. By a comparison of dates it appears that he had some time before this received the king's instructions to move in the matter of the divorce. Possibly Holinshed is mistaken with regard to the queen being of the royal party at Tyttenhanger. However this may be, the visit, which was probably a long one, is some evidence of the spaciousness of the Mediaeval mansion.

AMERICAN SILVERWORK.*

By H. TOWNSEND.

(Concluded from page 414.)

AS an Englishman I cannot help experiencing a sort of vicarious shame when I go into shop after shop, house after house, and see the same painfully glittering and meaningless surfaces, the same commonplace curves, the same lifeless ornamentation, and compare them all, in my own mind, with the constant delight and pleasure I experienced in New York as I turned over the contents of an ordinary shop show-case, or called upon some friend whose acquisitive faculty had led him in the direction of silver ware. Here in England we are content, not so much to endeavour to revivify a corpse, as to hospitably entreat and to be perfectly satisfied with the presence at our feasts of the mere mummy of an art. To travel out of the path beaten by the hammers, or the rut cut by the gravers of two centuries ago, seems to the English smith not

only useless, but positively vicious. His fashions may change, perhaps, but they change only as regards the model he is content to slavishly follow. When he is a copyist he is too often soulless; when he summons courage enough to be original he is generally mindless. In America, on the contrary, he is ever on the look out, not only among the archaeological dustheaps of the centuries, but in the world of science of to-day and in the almost newly-discovered world of still living Oriental art. From science he has borrowed many a secret of metallurgy. From the East, and from Japan especially, he has learnt many a lesson of form and colour. He has pressed into his service, sometimes, I own, with unwarrantable rapacity, the methods of other arts. He has not been content to simply engrave the surface of his metal, but has yearned for and obtained the freedom and facility of the etcher's needle. As regards this liberal and broad-minded subjection to outside influences, there is much that is worth consideration in the different attitudes which the English and American silversmiths have respectively assumed towards the marvellously beautiful and ingeniously scientific alloys which, under the names of shibu-chi and shakudo, the Japanese have known and cunningly worked for centuries; or towards the equally beautiful effects gained by the same artificers through the use of patinas, which give to silver and its alloys a bloom as of a sun-kissed peach or ripened plum. The English have passed them by with timorous indifference: the Americans have spent large sums of money and an affinity of thought and care, and while deftly refraining from any servile copying, have adapted rather than translated these foreign arts into their own language. You will see two or three examples of the curiously welded alloys to which I refer among the little collection here, and I would beg you to especially note that while the Japanese influence is undoubtedly strong, none of the pieces I have here could by any possibility be mistaken for examples of native Japanese workmanship.

It is, in fact, the strong desire of the American workman to avoid any appearance of actual copying, while I am afraid his English brother, supposing him to have the necessary skill to work in so ingenious a fashion, would use his utmost endeavour to turn out something which, in its imitative fidelity to the original, should deceive an expert Japanist. Even when he does not care to expend the time and labour necessary to produce these beautiful but necessarily expensive articles, the American silversmith has an eye for colour, and for the effects of contrast, which is apparent in some other of my examples.

His employment of copper, not in any secondary position, nor necessarily as a base metal, but as having a beauty of colour entirely its own—a beauty which may well be enhanced by the apposite radiance of the white metal—is as frequent as it is happy. The coffee-pot of Gorham manufacture, for instance, which you see here, is not by any means a perfect example of design, but it has, I consider, an amount of interest which would be altogether absent were it constructed entirely of the one metal. That the surface patina, produced by the slight oxidation of time, is an important factor in our admiration of unique metalwork, has also been fully recognised by the Transatlantic craftsman; and though I must confess he has carried this trick to an extreme in some cases, he has in others employed it with rare skill and good judgment. This fault of excess may be laid to his charge also in regard to the etching—of which I have before made mention—but that he was able to appreciate the value of a free as compared with a mechanically restrained incised line is certainly a point in his favour. In regard to this, I cannot resist telling a little anecdote which I only heard last night. An American friend of mine had a very dainty cigarette-case, etched with a freely-treated design of thistles, decoratively treated. The lines were coloured in a niello-like fashion, with a very soft and beautiful brown, a colour which gave value to and agreeably contrasted with the grey of the not too highly polished silver surface. She wished to have made here in London a writing-case to match her thistle-adorned cigarette-case, and to this end consulted one of the most eminent firms of silversmiths in London. They had never heard of etching upon silver, and did not believe it could be done, but they had no doubt they could engrave it to her utmost satisfaction. She debated with them upon this question of etching *versus* engraving, but to no purpose, and finally sent them the cigarette-case as a model, and trusted, somewhat feebly, for the best. Her writing-case arrived home, with stiffly-engraved commonplace thistles dotted here and there over its hopelessly-burnished and brilliant surface, and with it arrived what was once her beautiful cigarette-case, beautiful, alas! no longer. It looked like a piece of scratched and defaced tinware. When, breathless with indignation, she sought an explanation from the manager, she received the suave assurance, "You see, it looked so dirty that we thought you would like us to clean it nicely, so as to match our own work. I can assure you," he added, "we had to use strong acid in order to remove the ugly brown stains."

But I do not wish to give the impression that the American silverworker is wholly given up to what some of us may con-

* A paper read in the Applied Art Section, May 30, and published in the *Journal of the Society of Arts*.

sider his fads and affectations. He can meet the Old World artist upon his own ground, and equal, if not excel him. I think the best work we have in this country is that in which *repoussé* work is largely employed. I have a little toilet set, which has been kindly lent to me by the friend whose cigarette-case was so unkindly treated, which will show that the American *repoussé* work is not to be despised, though I by no means put it forward as a perfect example of its class. This little box, though chosen quite at haphazard, is evidence that while the mechanical skill displayed in their work is quite as great as that of our own hammerers, in freedom and individuality of design they are superior; while in the work with the graver, which may be said to add the cachet of distinction and personality to all good *repoussé*, they are, among modern workmen, unrivalled. Nor when they endeavour to work in a strict archaeological style are they at fault. What I have said concerning their adaptation from the Japanese holds good also as regards their treatment of Renaissance forms. The bag-clasp which you see here is an instance of this, trivial and slight though it may be. It is quite in the manner of Italian sixteenth-century work, as you will see, and yet with a distinctively modern note running through it. The little figures seem to me designed and modelled with a marked degree of graceful freedom, and yet of precision, while the cartouche of the buckle is in itself a lesson in little of the advantage of working in the spirit rather than according to the strict letter of a formal style.

I should also like to call attention to the pierced work, which, in its combination with glass, is so characteristically American. The flask you see here is an example of what I mean, and illustrates fairly well the manner in which they apply the methods of the old-time artists in metal to our nineteenth-century requirements. Nor have the Americans forgotten that they are the inhabitants of a country richly endowed with forms of natural life, which may be conventionalised and adapted to decorative purposes. The terrapin, the snail, and the bison have all been pressed into service with more or less success as decorative *motifs*.

I have been endeavouring, in sufficiently brief fashion, to impress upon you the fact that one at least of the arts of a country we are far too apt to consider as given over to the outward barbarian is worthy of our most respectful consideration. But let me insist that anything I may have said which appeared derogatory to our English work is meant to apply simply and solely to those articles of silver ware which any one can buy in any Regent Street or Bond Street shop, and on the other hand, all that I have brought forward in favour of the American work, as compared with our own, is confined equally to the same class of articles.

I have seen in England specimens of artistic work in silver and other metals which will compare most favourably with the creations of the cinque-centists and Mediæval metal-workers, but also invariably this work has proceeded from the studios of sculptors of eminence, or from the workshops of amateurs. I am not, of course, so foolish as to belittle the marvellous creations of such an artist as Mr. Gilbert, or even to undervalue the skill of Professor Herkomer, who at his house at Bushey has for some time been producing to his own design a service of carefully-modelled silver, which has much of originality to commend it.

In one respect, however, I may say a good word for our countrymen at the expense of the American. Ecclesiastical silver ware is to be found in some workshops here which cannot be paralleled either in America or in any other country in the world for its adherence to the best traditions of the Mediæval craftsmen. It is more than archaeologically correct, it is alive with the true spirit of the devotionally-minded silver-workers of an age when religion permeated the life of the artisan as well as of the priest. It is worth noting, by the way, that the same holds true as regards their architecture also. The American church work cannot be compared in any respect to the best of ours, though some of us are bold enough to consider that in domestic and commercial buildings they have a great deal to teach us.

Finally, let me endeavour to sum up the differences which I conceive exist between the silverwork of our own country and that of the world beyond the ocean. Here the workman is hidebound and fettered by tradition and trade custom. There he freely enlists into his service all that may in any way render his work more interesting or more individual. How much of this is due to the care that is taken in America to educate the workman in the art as well as the mere technique of his craft I am unable to say. Certain it is that a firm such as that of Tiffany, to which I have so often referred this evening, has made it a point not only to choose its apprentices and workmen from the more intelligent classes of the community, but have insisted on the necessity of their acquiring an education at the drawing-board as well as at the bench. To this end they have established special schools of art within their own little community, and their example has been widely followed by other leading firms. Nor should it be forgotten that of the purchas-

ing public of the two countries each has its own peculiarities, and I think the American silverworker, who desires to cultivate art for art's sake, meets with greater encouragement, financial as well as otherwise, from his clients. At the same time this indifference to novelty and individuality is one that acts and reacts. Our silversmiths here declare that they are never asked for anything more than commonplace conventionality, but, on the other hand, they make not the slightest attempt to lead the public off the well-beaten path.

We are distinctly not an inartistic nation, and especially so as regards the applied arts, and the cordial encouragement which, in spite of all growls to the contrary from some of our leading decorators, I venture to assert, has been given to the creators of a new school of applied design in woven and printed fabrics, pottery and ironwork, leads one to inquire, with some degree of plaintiveness, whether it is not time for us to take a step forward, in what should be one of our more characteristic, as it has been for centuries one of the most carefully cherished of our minor arts? May it not indeed be this very coddling and swathing up in bands of soulless tradition that has nearly stifled out its life, and if, even though it be at some loss to our self-esteem, we gain a breath of free air blown to us by the winds which set from off the shores of the New World, may we not look for a cordial acceptance of the new teaching by our art-loving English people?

ARCHÆOLOGY OF THE LEOMINSTER DISTRICT.

THE second excursion of the archaeological section of the Midland Institute took place on Tuesday and Wednesday in last week to the Leominster district. Arriving at Tenbury, says the *Birmingham Post*, the party crossed the river Teme by an ancient bridge, the original arches of which are ribbed, semi-circular in shape, and probably Norman in date, but they are nearly hidden by modern overhanging iron footpaths on each side, entering at the other end of the bridge the little town of Tenbury. Very little now remains of the old town, and the ancient church was nearly destroyed by a flood in 1770, and has been rebuilt in an ornate Gothic style. In the chancel, however, under a beautiful fourteenth-century canopy, lies a diminutive effigy of a cross-legged knight in chainmail. His hands were especially noted, as they are bare and hold a heart between them, and the mufflers of mail hang loosely from the wrists, being in this respect probably unique. The whole forms a fine example of a heart-shrine, and doubtless contains the heart of some knight who fell in the Crusades. Another mail-clad warrior (but this is an exceptionally large one) is partially built up in the wall of the south side; the legs are crossed, and he has a shield bearing the arms of the Sturmeys. In the same aisle is a very elaborate tomb, richly carved in alabaster, with a knight in Elizabethan plate armour, and his lady in the costume of the same period. There is an inscription showing it to have been erected by Dame Joyce, who married Sir Thomas Lucy of Charlecote, to the memory of her parents, Thomas and Mary Acton. Attention was also directed to the vestry, over which has been a room with a window opening into the chancel, doubtless for an anchorite or hermit, and to the tower, which retains its Norman character even to the belfry windows.

Returning through the town and recrossing the bridge a large tumulus near the river with three fine oaks upon it was examined, and the theory hazarded that it had been originally intended to mark the ford at that spot. Burford was reached in about a mile, some astonishment being expressed by those who had known the church a few years ago that the simple village fane of those days had been converted into a gorgeous piece of modern architecture by the architects of the Birmingham Law Courts, which building it strongly recalls. The old tombs, however, were always its strongest point, and these were carefully studied. The earliest is a deeply-incised brass within the chancel rails with the figure of a lady upon it. The Norman-French inscription being partly obscured, its date was gathered from the costume to be in the last half of the fourteenth century. Under a fine sepulchral arch, which may have been erected for the Easter sepulchre, is a well-preserved stone effigy of a lady, the Princess Elizabeth, sister to Henry IV., who died in 1426. Near it is a wooden effigy of a knight in plate-armour to Edmund Cornewaylle, who died in 1508. The colour of these effigies has been restored. On an altar-tomb, whose upper surface is a sheet of lead, is incised the effigy of a lady, Elizabeth Debroke, under a curious canopy. It is evidently the work of a maker of incised alabaster slabs. On the north side is a monument in the form of a triptych, externally painted with representations of the Apostles. Within are three figures, life-size, in Elizabethan costume, Edmund Cornewaylle and his father and mother. There is a corpse depicted below, and many coats of arms. Wonderful stories are told of the size and strength of this Edmund, who is painted 7 feet 3 inches in height. There are but two other such

triptyches in the kingdom. Round the chancel walls many other interesting tombs were noted, one to a lady who "lived to see seventeen score and more children raised from her body." Under a pointed arch in the south wall are two cavities with loose lids, another instance of the custom of enshrining hearts in the walls of churches, this one containing the heart of Sir Edmund Cornwaylle, who died at Cologne in the fourteenth year of Henry VI.

From Barford the drive was resumed through delightfully picturesque country, commanding grand views of the Clee Hills, to Whitton Chapel, which stands by itself among the fields. Its earliest feature is a Norman square door with plain tympanum, and it has a very plain square tower lighted by loopholes, and a few windows of the fourteenth century. About a quarter of a mile beyond, the old park wall and fine groups of gables and chimneys of Whitton Court are visible, a remarkable mansion of great beauty, externally built of the small bricks and stone quoins of the sixteenth century, but containing within the remains of a much more ancient and very interesting house of the fourteenth century. Situated in a park of considerable variety and extent, it stands on the edge of a small ravine, and is so clothed with ivy and creepers and so supported by groups of trees as to form a most delightful group from any point. Passing into a late brick porch the bold fourteenth-century arch of the door was noted, and within the extraordinary massiveness of the oak screen across the end of the great hall, also of the fourteenth century. The fine old furniture and valuable tapestry of the chief rooms were greatly admired, also the quaint quadrangle with its rich timber work.

The party next drove to Leominster. After supper the Priory Church was visited, under the guidance of the Rev. A. G. Edouart, vicar of Leominster. The church originally belonged to the monastery founded by Leofric, Earl of Mercia, hence the name Leominster. The late Sir Gilbert Scott, who superintended the restoration of the church, at a total cost of over 10,000*l.*, believed that the Norman portion of the church was standing before the Conquest; it certainly existed many years before the foundation of Hereford Cathedral, and is said to have been the mother church of the whole district. In point of antiquity it undoubtedly ranks with the oldest church now existing in the kingdom. The eastern portion of the original Norman church was entirely destroyed at the time of the dissolution of the monasteries, and has never been rebuilt. During the thirteenth century the Norman nave was used as the parish church, but the inhabitants, falling foul of the monks, were excluded from it; and for their accommodation a stupendous south nave was erected in place of the old Norman south aisle. Early in the fourteenth century a third nave was added. The church contains many objects of great interest, among others a consecration cross, some ancient encaustic tiles, and a fine chalice of pre-Reformation date.

After breakfast on Wednesday morning the drive was resumed through country of flat pastoral character to the village of Kingsland, whose picturesque cottages straggle for a mile along the high road. The church here is one of remarkable interest, having nave, aisles, tower and two porches in the Geometrical Decorated style of the earliest part of the fourteenth century, only one window being a century earlier. The clerestory windows of circular design are almost peculiar to this part of the country, and occur again at Pembridge. Opening out of the north porch, and having a window into the church, is a diminutive chantry chapel of great beauty, in which is a well-preserved stone coffin, under a richly-treated arch. On the east gable of the nave is a good example of the sanctus bell-turret. The Rev. T. G. Baillie produced a remarkably well-preserved and early volume of registers, and gave an interesting account of the chapel. Passing through Kingsland village, which contains many picturesque houses, and crossing the Roman Watling Street and the celebrated battlefield of Mortimer's Cross, where a pillar commemorates the sanguinary conflict between Yorkists and Lancastrians, the picturesque park of Shobdon Court was soon entered. Through this fine mansion, in the Louis XIV. style, the party was shown personally by Lord Bateman, and the building was eagerly examined. A perfect treasure-house it proved, teeming with objects of art and family portraits of great interest. The church was then visited and mingled feelings aroused by the extraordinary and probably unique example which its interior presents of the earliest Gothic revival, a result, probably, of the friendship of a past Lord Bateman for the designer of Strawberry Hill. A fine Norman font and the fine matrix of a brass in the churchyard aroused much interest, and ascending a slight eminence in the park a group of singular arches proved to be the remains of Shobdon Priory, removed from the site of the present church in 1752. Mr. Parker, the well-known architectural authority, has pronounced them to be "altogether one of the richest examples of Norman sculpture in existence." Shobdon Priory was founded in 1141 by Oliver de Merlimond, steward to Hugh de Mortimer; but the canons removed some miles further north and built Wigmore Abbey. A steep drive

was then descended into the village of Shobdon, which had not interest enough to call for a halt, and thence across the valley to Pembridge, which is now more than a village, and was in ancient times a town. Many old timbered houses and the steep roofs, tall and graceful windows and curious bell-tower of a grand old church, give the place quite a continental look, although the bad taste of owners has in many cases given a brick front and a slate roof to otherwise ancient houses. Dinner having been served at the Greyhound, itself a fifteenth-century house of timber, the village was explored. An old manuscript among the church records says that the town had a charter from Henry I., but that the market was then (1675) declining. The market hall is still standing in an open space surrounded by old timber and plaster houses, and is a very quaint and exceedingly picturesque object, being simply a hipped roof of stone tiles with moulded capitals and bases supported on a number of massive oak columns. In examining the church the party had the advantage of the guidance of the Rev. T. J. Hewitt. It is of great size considering the present population, and with the exception of a thirteenth-century column now built up in the chancel wall and a very fine thirteenth-century font, the building is entirely of the fourteenth century. It contains some fragments of original stained-glass and four fine freestone effigies—a local lord in civilian dress, his wife, a priest in unusual vestments (showing him to be a canon, or perhaps a dean), and a lady dressed like a nun, all of the fourteenth century. A very fine carved oak pulpit, altar-rails and carved pews of the seventeenth century, a fine brass chandelier of the early eighteenth, and unusually perfect registers, going back 300 years, were examined. A supposed sanctuary knocker for the use of the fleeing criminal and the very singular and imposing belfry, detached some yards on the north side of the church, received attention. The latter was evidently designed for defence, having no apertures but loopholes in the stone base, and the door bearing numerous shot and bullet holes.

Less time than it deserved could be spared for Pembridge, and somewhat reluctantly the drive was continued through three miles of pretty pastoral country to Eardisland, through the midst of which charming village the Arrow runs under a picturesquely-disposed but not too ancient bridge. Close to the waterside the ancient school-house of timber has recently been modernised to form a village reading-room, but against its wall a very rare example of the ancient village whipping-post, with its manacles for locking down the wrists of the culprit, remains in good condition. With the 4.11 train to catch at Leominster no time could be spared for the church, though its interest and antiquity were manifest at a cursory glance; but passing down the waterside the Rev. J. Barker, a local antiquary of celebrity, was by great good fortune encountered in front of his own house, a delightful building of quaintly-grouped timber and plaster gables and high-pitched stone roofs, which proved on examination and elucidation by its owner to be a most interesting instance of a fourteenth-century hall; the fine oak-arched principals and ogee-shaped wind-braces of a very fine roof could be seen in several of the bedrooms which have been in later times constructed within it. Much regret was expressed that through indisposition the hon. secretary, Mr. Cossins, could not be present, this being a singularly perfect and clear illustration of a subject to which he has given much attention in Warwickshire.

GEOMETRY IN DESIGN.*

(Concluded from page 410.)

OF the endless applications of the conic sections in the details of the Greek porticoes, it will be possible only to touch upon a few. The flutes of the shafts, we may note before proceeding further, were constructed of various sections. Speaking generally, the Doric flute was described having given its depth, which might vary, and the distance between the arrises. On this chord an equilateral triangle was described, with the vertex of which as centre the central part of the sectional arc was drawn. This would not evidently, in general, pass through the extremities of the given line joining the arrises, and therefore the sides were completed by arcs drawn from two other centres, and of smaller radius. The part of the arc, however, drawn from the first centre was determined by the directions of lines drawn from the vertex of the equilateral triangle to the points in which each half of the distance between the arrises is bisected.

The Ionic flute has been said to be exactly a semi-ellipse, but curves which answer closely to the original have been described as false ellipses from these centres. The curve of the flute of the Erechtheum has been described as a false ellipse stuck from five centres. But it would probably be difficult to distinguish practically between these interesting

* A paper read by Mr. H. A. Saunders, M.A., at the meeting of the Society of Architects, Mr. A. E. Stoner, member of council, presiding.

approximations and the true ellipse, of which the major axis is the distance between the arrises, and the minor axis the depth of the flute. It is worth noticing that the section of the flute changes as we proceed from the base towards the capital, becoming deeper and sharper at the edges as we rise higher. This variation, in Penrose's opinion, produces an excellent effect in deepening the shadows as we ascend, and leading the eye to the more complicated light and shade effects of the capital and entablature.

The proportions of the various parts of the column, though determined by more stringent rules than in Egypt, were yet somewhat elastic. In the Doric order the width of the abacus was always one-fifth of the height of the whole column, and in the Ionic one-eighth. These proportions were departed from only in a very slight degree; for example, the corresponding fractions in the case of the inner columns of the Parthenon was three-sixteenths, and in the case of Ionic columns of the vestibule of the Propylæa four thirty-thirds. The dimensions of the parts, however, seem to have been allowed to vary in different examples; only it must be remembered that the upper parts were made larger in proportion than the designer wished them to appear, to allow for the fact that they were seen at a somewhat greater distance. In fact, they were designed so that the visual angles, as determined from the point of sight from which the work was to be seen, might bear to one another the proportions which the designer conceived to be most desirable. When we remember that if a stick 10 feet in length were placed with one end at the height of the Parthenon capital above the upper step, the difference in apparent height according as it were turned vertically upwards or vertically downwards would, supposing it were viewed at a distance of 50 yards, be very nearly represented by an angle of 5 inches, or the angle subtended by a length of less than 3 inches placed at the same distance, we can form an appreciation of the delicate accuracy with which such work was designed.

In the case of the capitals and mouldings, conic sections are again found; but in these cases, as compared with the columns, the hyperbolic curves being of smaller eccentricity are recognised with much greater certainty. The parts also have been cast and sections of the castings traced. A simple graphic construction will then determine whether the curve assumed to be a conic section is a hyperbola, an ellipse or a parabola, and at the same time to fix the centre of the curve. It is then easy to determine on paper the direction and magnitude of the transverse or major axis, namely, by describing a circle concentric with the curve and bisecting the angles between the radii to the points of intersection. The curve then reconstructed from the elements so determined has been found to coincide very closely with the curve as traced from the cast, which is thus identified. In this way the ovolo of the Doric column, on the exactitude of which the beauty of the capital almost entirely depended, has been found to be a hyperbola of eccentricity represented nearly by the ratio 9 : 4, with which it will be useful to compare the ratios of 30 : 1 and 150 : 1 found for the curves of the entasis of columns of the Doric and Ionic orders respectively. The centre of this curve is very nearly marked by the vertical line determining the projection of the abacus.

The curves of the hypotrachelium in the same order present some little more difficulty, because in order to produce the greatest concavity immediately underneath the annulets, the axis of the hyperbola which defines the curve of the fillet between the flutes is inclined to the vertical. The edges of the annulets follow the same curve, whose centre is within the column, the concavity being, of course, outwards. The direction of its axis and the position of its vertex being found, as before explained, the perpendicular distance of the lowest point of the hypotrachelium curve from the axis can be measured, and this is found to bear a simple relation to the major axis, which relation varies, however, slightly in passing from one example to another. The curve of the section of the hypotrachelium through the bed of the flute is again a hyperbola of smaller eccentricity with its axis still more inclined to the vertical. Of the three hyperbolic curves in the Parthenon capital, the outer hypotrachelium curve has the greatest eccentricity, the ratio being between two and nearly three to one. The curve of the bed of the flute comes next with a ratio of about 4 : 3. The curve of the echinus gives approximately a ratio of 3 : 2. If we were fortunate enough to have had handed down to us the works of Greek designers, which we know to have existed, we might have been able to judge more accurately of the bearing of these dimensions of the curves on the light and shadow effects of this simple yet most elegant design.

The Ionic capital, scarcely so elegant it may be thought as the Doric, is said to be of Assyrian origin and to have had its prototype in the twisted horn of the goat or antelope. Its construction must have involved very considerable geometrical detail. The volute is its most prominent feature, but the other portions supply instances of the application of the parabola, ellipse and hyperbola.

According to Vitruvius the Ionic volute was described by

means of arcs of circles. Working on this hypothesis, Mr. John Robinson has produced a construction for describing its spiral, of which an indication may be given, and which, viewed as a geometrical construction, is of singular neatness and interest. He describes a series of rectangles within each other, following the law that any three consecutive sides must be in arithmetical progression. By bisecting the angles of these in succession he determines a series of smaller rectangles, the middle points of the sides of which give the centres of consecutive quadrants, if they may be so called, of the curve.

The remaining parts of this capital must be briefly referred to. The abacus is no longer square, as in the Doric, but shows a bevelled face, the section of which is a small hyperbolic arc with its vertex nearly at the upper edge. In the section at right angles to the return face of the volute we have a curve in some cases parabolic and in some cases hyperbolic, continued in the lower or as it were rolled up part by segments of circles or by an elliptic continuation. So that even without considering the nature of the curves of the ornaments, we find in some examples instances of the use of each class of conic section.

The soffit of the cornices in all cases seems to have been treated most carefully, possibly because in viewing the work from the ordinary point of sight, from beneath, the gradation of shadow upon them became a matter of importance. Whatever be the cause, in their sections, hyperbolas and parabolas are found with their vertices in some cases in the part of the curve employed, so that occurring, as the vertices do, just behind the face of the cornice, the moulding is at its outer edge for a short time nearly parallel to the outer face.

The Greek ornamental patterns were also designed by grouping together arcs of the same curves, and probably the contours of their vases, and the patterns inscribed on them will prove to have conformed to similar geometrical law. In the case of the Doric work the patterns, the egg and tongue, for example, and the "water pattern," were traced on the moulding and painted without sculptured relief. In the Ionic order they appear sculptured; but the patterns traced from the remains in Doric porticoes and placed on a plane surface give curves of all three classes of conics.

The Greek in his artistic aims adhered to the rule of æstheticism pure and simple; to use his own words he "followed the cult of beauty." The Roman, with much less attention to detail, built with a view to general stately effect. Thus he adopted the arch which the Greek had rejected, and thus too he generally ignored the delicate geometrical expedients in which, as we have seen, the Greek delighted. The temples, basilicas, arches and other remains of ancient Rome would only serve to illustrate in a less degree the geometric principles which attained their highest development in the best period of Athenian art.

Passing over then the monuments of Roman antiquity, we find in the early work of Christian times, except in so far as Christian work was influenced by Classical models, a simplicity which began to show efforts at more complicated effect in the Transitional Norman, Early English and Decorated periods—periods, it is to be noticed, strongly affected by the influence of the communications which the Crusades established between the East and the West.

That this did not result in an earlier return to Classical models was due to the loss of the scientific principles which had governed Classical work and to a Christian contempt of Pagan art, which certainly lasted down to the sixteenth century: witness the famous remark with which Pope Adrian VI. dismissed the art treasures of the Vatican—"Sunt idola antiquorum." But in their contact with the East, the Crusaders must have fallen under the influence of Eastern, and more particularly of Syrian Christianity, in which the Gnosticism that St. Paul encountered in Asia Minor still flourished. This hybrid Christianity drew alike from Kabalistic and from Neo-Platonic sources; and the home of Neo-Platonism, the abode of "the Jewish Plato," Philo-Judæus, was Egypt. Hence there can be little that Western Christianity became subject in a greater or less degree to a principle of symbolism, based to a great extent on mnemonic geometrical forms, and reverting in some measure to the symbolical forms of earlier Egypt.

It is possibly to this source that is due the use of the pentalpha or figure formed by joining the alternate angles of the regular pentagon, an example of which is to be seen in the south aisle of Westminster Abbey. This figure changed its significance from a symbol of health, representing the equally healthy development of the five senses of man, to a mnemonic indication of the five wounds of our Lord. The figure formed in a similar manner from the regular hexagon, and known as the hexagram, had its original symbolical significance, which is very probably of Egyptian origin, in the idea of the subordination of the lower nature of man, unstable, and represented by the equilateral triangle with its vertex downwards, to the higher or stable nature represented by the triangle placed on its base. The same principle of symbology is reproduced in the

"Beauséant," and in the "Vexillum Belli," the flags of the Templars, in which the lower part was coloured black and the upper white in indication of the victory of the powers of the upper world, as represented by the Christians, over the powers of darkness, personified by the Saracens.

The geometrical figures of this class are generally from their nature of stereotyped form, and therefore can have little reference to artistic work considered merely from its æsthetic side; yet their symbolism is of wide and varied historical and artistic interest, and it must suffice to refer to one or two such forms.

In Egyptian art we constantly find the hieroglyph known as the "crux ansata," or Nile key, consisting of a lenticular form attached to the tip of the "Tau cross," and forming what is conventionally known as the "handle" of the key.

The "Tau cross," introduced from Byzantine sources, but a pre-Christian symbol, is found in the capitals of Norman work, as in the Chapel of St. John in the Tower and elsewhere. The lenticular part of the symbol also occurs very widely in Christian art in the form of the *Vesica Piscis*, a form, be it observed, almost invariably used to indicate the divinity of the person enclosed therein, and hence employed to surround the central figure in later representations of the Crucifixion.

Now the central principle of the system of philosophy known as the Kabbalah was—to put it as briefly as possible—that the universe was not the creation of the Deity directly, but that He sent forth ten Sepheroth, or emanations of His own essence, to whom was entrusted the foundation and support of the worlds. These emanations were indicated on mystical diagrams—in some of which, by the way, the hexagram occurs—in some of which the Deity, still encompassing and controlling these emanations of His own Being, is indicated by a *Vesica Piscis* surrounding the whole. One of these diagrams was adopted by the Grand Master of the Templars as his seal, and presented the form of a triple cross surrounded by the *Vesica Piscis*.

This seems to point to the Templars more particularly among the Crusaders as a medium for the introduction of Eastern symbology; a conclusion which is strengthened by the consideration that at the time of the dissolution of the order in the thirteenth century, and when the Geometrical Gothic was beginning to merge into the Flowing style, the charges of idolatry made against the order were based on the discovery in their Commanderies of gems engraved with symbols, which the members of the order were said to worship idolatrously. These symbols were without doubt merely esoteric representations of Oriental philosophy, partly Christian or rather Gnostic, partly Kabbalistic, and perhaps derived originally from Egyptian occultism.

Whatever may be the ultimate determination of such points, if they can be determined, it seems very probable that much Christian mnemonic art has its origin in pre-Christian times. It is only natural that if such symbols are due to adaptation they should have been modified in the process. The variations of the *Vesica Piscis* for example are very numerous. We have seen illustrations of the use of both parts of the Nile key. If the symbol exists as a whole in Christian art, it will be found probably in a disguised form. It is, perhaps, worth while bearing in mind the connection between the Templars and the mystic systems of the East to consider the question whether the complete form of the Nile key is not embodied, though perhaps in disguise, in the combinations of rectangular and circular forms which exist in these our few remaining relics of the Order of Templars.

In conclusion, acknowledgment is gratefully made of the kindness of this Society in providing views for the illustration of this lecture, and of indebtedness to the works of Pennethorne and Robinson, Penrose, Prisse d'Avennes, Hulme and other authorities, and to papers by Mr. D. Fearon Ranking for the preparation of its substance.

MODERN AMERICAN COUNTRY HOUSES.*

LET us take up the designing of a country house as an architect takes it up in each individual instance. First, as to arrangement; and, before we can do very much definitely with that, we must have some notion of the general appearance of the house as we wish it to be; whether a blocky mass, after the fashion of the quasi-classical house of a century ago, such as the old house until recently existing in the upper part of New York City, or whether a thing of points and gables tossed together skilfully and artistically, such as the more modern house at Short Hills, of neither of which examples do I know the name of the designer; whether low and rambling, or piling up pyramidally. No matter which the surroundings and circumstances may lead us to select, we can make a good thing of it as a design outwardly if we are clever enough.

Having made sure of what we want as to general effect, and, if we know what we are about, having been influenced in the choice by no considerations of fashion or imitation, but solely by the consideration of what will best suit our location, we try what sort of an interior we can devise that will work with such an exterior as we are aiming at.

We would like, perhaps, a square entrance hall, with no vestibule, a large dining-room, and a larger drawing-room, as it is now the fashion to call it, reviving the name by which it was known to me in boyhood. Besides, we want a library, to be used also as a smoking-room, a sitting-room, or morning-room as it is called in England, although the functions are not quite the same, as the English morning-room is used for breakfast and luncheon, as well as for general use between meals. There will be bedrooms wanted, of course, as many as we can get, probably more than can be placed above the lower rooms in one storey.

With all there will be a strict money limitation, so that it will be no wonder if we have to weigh each requirement, relinquishing some, modifying others, insisting upon a few in order to make the outside, the inside, and the appropriation harmoniously fit together.

In arranging our rooms some of the English customs may be studied to advantage. In American homes the desire for wide sliding doors between the principal rooms is very general. The effect, when these doors are open, is spacious and pleasant, and the practical utility when the whole house is open for entertaining is evident. In England such wide doorways are unusual; each room is separate, giving a new scene and new interest as we pass from room to room.

In our larger country houses there is a tendency to approach the English model in many respects, like causes as usual producing like effects. Such a tendency is shown in the plan of a country house in West Virginia by C. T. Mott. The great hall is about sixty feet long and the dining-room about forty. The development of a class of people of independent means and not depending on their labour for their living is producing very much such a house as the same class, long existing in England, has found best suited to its tastes there. The most marked feature is the double entrance—the carriage-porch and the garden entrance, the one for the mere business of entering, the other the approach to the pleasure grounds, park, garden, or often merely what we would call a yard.

How spontaneously similar circumstances generate similar solutions is illustrated in the plan of a country house to be used as a shooting-box, designed by the writer. There was no especial attempt to imitate English methods. Given a large forest tract, where wild game abounded, a taste on the part of the owner for the chase, a house to be used chiefly for the gratification of this taste, the plan naturally follows. One storey high, because there is no need of condensing into two or three. No cellar to speak of, because the coolness of the summer requires none for keeping things cool, and, the occupation being only in summer, no cellar is needed for heating apparatus, or as a frost-proof place of deposit. Immediately we have what is essentially the English country house. A large hall, paved upon the surface of the soil, properly prepared, in this case paved with brick; long rambling corridors, running off in one direction to bedrooms, in another to kitchens and the other offices, a dining-room, and a quite subordinate drawing-room, a boudoir for the ladies' use, a cosier refuge than the great hall. Finally come the stables and kennels enclosing the gravelled quadrangle.

The Hempstead house, by the writer, gives the double entrance again, the garden front—always the principal part—upon the lawn, the real entrance with covered carriage-porch in the rear.

Some English arrangements will not bear copying—their manner of separating the dining-room from the serving-room and kitchen, for instance. In a way that is manifestly studied, but for what real reason the American mind finds it hard to guess, their dining-rooms are placed so that all the dishes must be carried across the main hall, through the only door which is provided for entrance. Inquiry has disclosed that a dining-room with more than one doorway is looked upon as "a terrible place for draughts," and in a country where unwarmed halls and bare neck and arms for dinner are the custom such considerations are necessarily paramount.

When we come to actually carrying out whatever plan we finally work out, the expediencies to be weighed and questions to be settled are innumerable. For most of them no perfect solution can be found; it is at the best accepting the inevitably imperfect. In every case, too, we must aim at the reasonably practicable financially; the very best way is often too costly to be prudent, even if there is money at hand to pay for it.

For the material of the outside stone is rarely available. Rough field stone when found on the spot may do well enough, but even then it is far more costly than the framed construction. The latter is the usual resort, covered with shingles, or rough cast or clap-boards, if we can condescend to such banality. There is nothing more generally available than

* From a paper by Mr. John Beverley Robinsen, published in the *Engineering Magazine*.

shingles; cypress last longest and greys well with the weather. Although white pine gives a whiter and more silvery grey, it is not so enduring. Cedar shingles turn blackish rather than grey, and are better stained.

Cement, plain or covered with pebbles, does well for parts or for the whole, and suggests masonry in a very satisfactory way. I have a notion that slate could be used more than it is for covering the sides of houses, as well as the roofs. The trouble is the objectionable colour of the ordinary black slate—the excessive uniformity of the market slate of all kinds. There is beautiful slate to be obtained which is regarded as waste by the quarries, very much as until recently the most beautiful brick were rejected by the kilns because they did not meet the demand for uniformity of colour. These inferior qualities, as they are considered, I have reason to believe are of as good quality as many others for wear. After a year or two they change colour irregularly, fade into soft blue greens, olives or browns, which make with the original green or purple a colour effect which it is a joy to behold.

They have a way in the West of veneering houses with brick, which is a perfectly legitimate and available resource. There they use it to imitate a brick construction, but such a fatal attempt at imitation is easily avoided. Properly used, a veneered brick house will have a character of its own, and can be made no less satisfactory than shingles.

There is one point trifling to the unprofessional mind, but very important to the professional. I speak of what are called flashings. These are the metal-sheets used for making tight joints in the angles of roofs, about chimneys and in other places. Tin, however well painted, is sure eventually to rust into holes. Zinc is rustless and cheap, but apt to crack in putting on. Lead is good for many reasons, but best of all is copper. Use copper, if your purse can stand it, by all means, for flashings, gutter-linings and all similar purposes. If not copper, lead and zinc judiciously used are always available—zinc in small pieces, where much bending will not be needed; lead over doors and windows and built into chimneys for what are known as “cap-flashings.” These make tight and permanent work.

In the interior the chief part of the work is plastering; the chief part, that is, in superficial measurement, as five sides out of six in each room are usually plastered. Of late years what are called hard plasters have been introduced. These are said to be substantially of the same nature as the well-known Keene's cement—that is, of plaster of Paris mixed with alum and reburned. Asbestos fibre is mixed in to take the place of the usual hair. There are various makes of hard plaster, all of which are said to be good; the only one of which I can speak from experience is the “Windsor cement.” Of this, one virtue I can distinctly affirm; and doubtless there are others which have the same advantage. It does not fall from the ceiling, no matter how much it may have been saturated. In other ways the hardness is of advantage, especially against the bruises and marrings caused by accidental knocks from furniture or otherwise. Hard plaster, however, has two drawbacks; the first is that workmen are apt to put it on as ordinary plaster is put on, which is sure to make it worthless; the other is that the harder and better it is the more it transmits sound through partitions and floors. With floors this is easily remedied by a layer of soft felt paper; in partitions no convenient and inexpensive remedy presents itself.

Floors come next to plastering, and are much more difficult to make satisfactory. Double floors, of course, we must have, the under floor as rough as you like, only the boards must be of even thickness, and it is better to lay them diagonally than across the beams. Laid across, each wide board is sure, when it shrinks, to gather three or four of the narrower boards of the top floor together, making a wider crack than usual at that point. When they are laid diagonally this difficulty is avoided. On this rough floor we will lay a thickness of deafening paper—asbestos, if we can afford it. The real trouble comes with the top floor. No matter how much care is used in drying the material, cracks are almost sure to appear after a winter or two of furnace heat. The narrower the boards are, the narrower of course the cracks will be, and the more expensive the floor. In fact, if we must have the best floor possible, I should use the parquet floor put down by experienced men who do nothing else. The cost would not be prohibitory, even for an ordinary fortune, not so very much in excess of a hard-wood floor in very narrow strips. It is possible that something in the way of a continuous paper floor may be seen in the future; the inherent defects of a wood mosaic are insuperable. Such a paper floor I fancy I could construct, but such new devices are not commercially available until somebody devotes himself to manufacturing them.

One word about windows. The usual guillotine sash, though the most convenient, is the ugliest thing possible. You may take your choice, beauty and draughts, or ugliness and what the yachtsmen call “weatherly qualities.” On the other hand, nothing can be prettier than the casement sash, opening outward. They are out of the way, too, of curtains and furni-

ture; but, besides the other defects which almost all casements have—of not being tight, and of slamming and breaking the glass—they have a curious and unforeseen drawback, it is impossible to wash them on the outside without a ladder, or taking them off their hinges and lifting them bodily indoors. A pretty arrangement which avoids this inconvenience is sometimes available. The window is divided into four parts in width; the middle pair of sashes open outwards, the two sashes at the sides open inwards, but are only intended to be opened for the purpose of washing the middle pair.

All the rest of the construction of the house—doors, stairs, closets, pantry arrangements, dumb-waiter, and such trifles, no doubt they seem as door-knobs and sash-fastenings—I pass over; but to each the architect must give some consideration.

After the main part of the actual construction has been determined the no less important matter of appliances is to be thought out. By appliances I mean gas-fitting, plumbing, drainage and heating. Sanitary plumbing has been pretty well exhausted as a topic, written and rewritten to revulsion. With drainage the case is much the same.

Pages might be filled with such considerations, upon the fifty or a hundred items that go to make up a house; but which I chiefly wish to convey is that each way of doing each thing has its advantages and its corresponding disadvantages. The work of the architect is to balance these as best suited to the matter in hand, so as to secure a practically, æsthetically, and economically harmonious result.

LONDON COUNTY COUNCIL BUILDINGS.

AT the meeting of the London County Council on Tuesday a report was submitted by the Establishment Committee on the schemes for a county hall, which were initiated in 1889 in consequence of the growing wants of the Council for increased space. In 1889 the staff in the central offices numbered some 200; it had now risen to 350, of whom 100 were located in different houses away from the county hall. The committee gave extracts from the reports prepared by the Offices Committee in 1890 and in 1892 dealing with various suggested sites. These sites were:—1. Christ's Hospital site, which the Offices Committee did not consider suitable on the ground that the frontage to Giltspur Street and Newgate Street was so small, and that a large portion of the ground was “back land,” over which there were several rights of light. The cost of acquiring the total area would probably exceed 500,000*l.*, which the committee thought was a figure which precluded further consideration being given. 2. Victoria Embankment site (City), which the Offices Committee stated in July 1890 consisted of an area of 2½ acres, or 99,500 feet. Subsequently, however, a large portion of the site in the rear was disposed of, leaving only 53,043 square feet available, of which 7,301 square feet was over the District Railway; they therefore deemed the site unsuitable. 3. Site at Holborn, including Barnard's Inn, of over an acre in extent, an area, in the opinion of the committee, too small for the purposes of the Council. 4. Site near the British Museum, comprising nearly three acres, abutting on New Oxford Street and Tottenham Court Road. On asking for further particulars the committee ascertained that the land under ordinary circumstances would not be offered for sale, nor that any valuation of the freehold had been made. The committee came to the conclusion that the site would not be a suitable one. 5. Millbank Prison site, regarding which the Offices Committee stated that it was suggested by Mr. S. S. Tayler, who estimated the cost of it at 120,000*l.* After considering the matter, the committee were of opinion that the site was not sufficiently central, and that the price suggested was not in conformity with the views of the Home Secretary. 6. Foundling Hospital site, which the committee considered extended beyond the order of their reference. 7. Warehouse property in Fenchurch Street, the only particulars of which were given were that the property comprised an area of 107,000 square feet, and that the price was 7*l.* per square foot, equal to 749,000*l.* The price appearing exorbitant, the committee did not think it expedient to obtain further particulars. 8. Farringdon Market site, regarding which the Offices Committee considered that the area was somewhat limited for the future requirements of the Council, and was further restricted by ancient lights. The site was afterwards sold. The Establishment Committee then proceeded to deal with the sites considered by themselves. With regard to the Salisbury estate property, the committee reported that an offer had been received from the Official Receiver in March last to sell it to the Council at the price of 400,000*l.* With regard to the building, they were of opinion that it could not be adapted so as to make satisfactory municipal offices. The committee had also considered the suitability of a site on the Victoria Embankment, between Horse Guards Avenue and New Scotland Yard, but on investigating the matter they found it was hardly

adequate in size, and, further, that they could not obtain the principal portion. Since their previous report communications had been received from the clerk to the governors of Christ's Hospital, inquiring whether there was any probability of the Council treating for the whole or a portion of the hospital property, and intimating that the total area now available would be about $3\frac{1}{2}$ acres, and from the chairman of the Royal Aquarium Society with reference to the property of the Society. They had considered these communications, but they did not think it desirable to make any alteration in their recommendation, which was that the offer to sell to the Council, for the sum of 750,000*l.*, the Parliament Street site be accepted. To this recommendation notice has been given of amendments by Mr. Arnold, Mr. Boulnois, M.P., and Mr. Fardell.

The attention of the London County Council has been again directed by the Official Receiver (Mr. C. J. Stewart), who has charge of the affairs of J. W. Hobbs & Co., now in course of liquidation, to the suitability of the Salisbury estate property for the purposes of the Council. The property, which has an area of $2\frac{1}{4}$ acres, consists of the main building, having a frontage to the Embankment of about 216 feet, and a depth of about 94 feet; a block of buildings on the west side, adjoining Adam Street, Adelphi, now in course of erection; and twelve houses on the east side, at present producing a rental of 865*l.* As planned, the principal entrance to the main buildings was to be from the Strand; but it is pointed out that if the Council decided on the acquisition of the property another entrance could easily be made on the southern side, with a drive up through the gardens on the Embankment. The main part of the building contains a hall—originally meant as a dining-room—which could be adapted for the Council's chamber, with seating accommodation for 158 councillors, and two galleries, one for the Press and the other for the public, the latter seating 168. The measurements of this hall are about 74 feet by 54 feet, and the height is 28 feet. If, however, this hall were not considered suitable for the purpose of the council chamber, it is suggested that the piece of ground on the eastern side of the property, about three-quarters of an acre in extent, on which are the twelve houses above referred to, could be made available as a site for the erection of a much larger chamber. Besides this hall the building contains nearly 300 rooms; some of them are large, but the greater number of them are small; the latter, however, it is said, could be enlarged at little cost by taking out partition walls. Under the courtyard, which lies between this building and the Strand, are a number of vaults with an underground roadway, which are estimated to produce a rental of 4,500*l.* a year. The whole property (site and buildings) when it came into the Official Receiver's hands was mortgaged to the extent of 692,000*l.* (the third mortgage, that to the Liberator Society, being for 452,000*l.*), and is now offered by him to the Council at 400,000*l.* The cost price of the land alone was 200,000*l.*, which works out at 2*l.* 14*s.* a square foot; and the price of the property in its present state, with the buildings partly erected on it, works out at 5*l.* 8*s.* a square foot. In this connection it will be remembered that the price of the Parliament Street site, recommended by the Establishment Committee to the Council, worked out at 7*l.* 13*s.* a square foot. The Official Receiver further states that he has had an estimate made of the cost of finishing the main building and making it ready for use, and that such cost would not exceed 60,000*l.*

NEWBATTLE ABBEY.

THE members of the Dalkeith Rambling Club lately paid a visit to Newbattle Abbey, the Mid-Lothian seat of Lord Lothian. Mr. Ramsay, clerk of works, was in charge of the party. After seeing the famous beech tree, the largest in Scotland, the company walked to the Abbey house, at which various interesting matters were stated. The Cistercian monastery of Newbattle was founded in the twelfth century by David, and by then almost universal custom the site, in a valley at the side of a running stream, was chosen with various practical considerations of great importance. Excavations made in 1878 and more recently laid bare the foundations of the church and the walls of a conventual residence. The north transept has two angle buttresses of large dimensions, the north wall being 7 feet 6 inches in thickness and 46 feet wide inside between the east and west walls, including the side chapels. From the inside of the north wall to the north aisle is 30 feet 9 inches, and the length of the main building from the great western door to the east end of the chancel is 293 feet, whilst the width across the nave and aisles is 57 feet. The width from north to south transept, including the crossing, is 122 feet. The only other abbey in Britain having great angle buttresses is that of Furness, in Lancashire, but these are on the corners of the chancel at the east end. Furness Abbey was founded nearly twenty years after Newbattle. The Abbey of Newbattle was twice destroyed by fire, in 1398 and in 1544.

Otis Electric Elevators.

SIR,—We are having so many inquiries as to whether or not we have an exhibit in the exhibition at Chicago, and those inquiries have indicated so much of interest in the subject, that perhaps we may be allowed to state through your columns that this company has no exhibit, its business being entirely confined to the countries on this side of the Atlantic. Our American friends, however, Otis Brothers & Co., of New York, and Hale Elevator Company, Chicago (all of whose patents for Europe we own), have a large exhibit of all the different types of hoisting machinery, including two electric elevators of different types. They have entered as an exhibit the eight passenger elevators which run from the main floor to the top of the tower in the transportation building, and they have the only elevator plant in operation in the great building of manufactures and liberal arts. These are electric. In both the transportation and liberal arts buildings the elevators land passengers at platforms communicating with walks extending around the upper portion of the roof on the outside. This walk, in the case of the latter building, is fully half a mile long, about 220 feet above the ground, and commands the finest view of the fair grounds that can be obtained.

As the owners of all the European patents of Otis Brothers & Co., and as our productions are identical with those referred to in the United States, the name of this company appears on all these exhibits.—Yours faithfully,

WM. AUG. GIBSON, Managing Director.

Otis Elevator Company, Limited: June 22.

GENERAL.

Mr. J. Hunter-Duvar contributes to the *Reliquary* for July an article on "The Dawn of Art," illustrated. Articles are also given in the same issue on "The Misericords in Limerick Cathedral," by D. Alleyne Walter; "The Pre-Conquest Churches of Northumbria," by Charles Clement Hodges; and "Some Sculptured Stones at Boroughbridge," by Alex. D. H. Leadman.

The Clifton Antiquarian Club, under the guidance of the secretary, Mr. A. E. Hudd, have made an excursion to Bath and inspected the abbey and the Roman baths, which they were shown by Major Davis, F.S.A., the city architect. They then went on to Wellow and examined the tumulus at Stony Littleton, under the direction of the Rev. H. H. Winwood, and afterwards inspected Wellow Church.

Mr. John Henry, architect and surveyor, Durham, has passed away in his seventy-ninth year, after a painful illness of some months' duration. His practice was mainly in that city, and for fifty years he held the appointment of clerk of works to the university. Mr. Henry has left a widow, one daughter and three sons.

Mr. Lewis Barrett has prepared plans for the drainage of Portslade and Southwick, in Sussex, which have been adopted by the Steyning Sanitary Authority. The work will cost 13,000*l.*

Wilhelm Scholz, who was during several years one of the most humorous draughtsmen on the "Kladderadatsch," has died in Berlin.

A Statue of Jules Grévy, the work of M. Falguière, has been set up in the Place Pinzon (now Place Grévy) in the town of Dôle. The President is represented standing, and at his feet is a figure of France offering him the tricolour. The cost of the memorial was mainly borne by the Grévy family.

Mr. George Wood has resigned the office of head-master of the Sidney Cooper School of Art, Canterbury, which he has held for six years.

At the General Assembly of the Royal Society of British Artists the following gentlemen were elected members, viz.:—Messrs. Gilbert Foster, H. G. Hewitt, N. A. Loraine, Wm. Manners, Arthur Ryle, G. Hillyard Swinstead, W. E. Tindall, Leonard Watts and Walter West.

The Annual General Meeting of the Dundee Institute of Architecture, Science and Art was held yesterday (Thursday), when the annual report was presented.

The Chapel Royal, Stirling Castle, is being cleared out, and excavations conducted beneath where the altar stood. It is supposed that the Regent Lennox, who was killed in Stirling in 1571, was buried there.

Professor Copeland reports that considerable progress has been made in the erection of the new buildings for the Royal Observatory, Edinburgh.

THE Architect and Contract Reporter.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Reporter to THE ARCHITECT."

THE ARCHITECT AND CONTRACT REPORTER.

THE BLACKMAN VENTILATING CO., LTD.

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.
All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

Head Office:—63 FORE STREET, LONDON, E.C. Branches at MANCHESTER, BRADFORD, BRISTOL and GLASGOW

THE DENSMORE.**THE WORLD'S GREATEST TYPEWRITER.**

TO ARCHITECTS.—If you have come to the conclusion that the use of a Typewriter for writing your Specifications and Contracts will **SAVE YOU TIME AND MONEY**, give the DENSMORE a thirty days' trial before purchasing any other.

The Machine may then be returned if not found satisfactory in every respect, and a decided advance in typewriting mechanics.

If you decide to purchase it, we guarantee it free from all mechanical defects, and keep it in order for two years free of any charge.

TWO CARRIAGES, fitted with **SOFT AND HARD CYLINDERS**, which are instantly **INTER-CHANGEABLE**, are furnished with each Machine without extra charge—thus one DENSMORE performs the work of two ordinary machines.

NO LIFTING OF CARRIAGES REQUIRED IN ORDER TO SEE YOUR WORK.

If you require anything in Typewriting Supplies, give us a call and look over our stock. We have seventy-five different grades of Typewriting Papers and a large stock of the best Carbon Papers. Typewriting of all kinds neatly and promptly executed by a corps of skilled operators.

The Densmore Typewriter Co., Ltd.
51 GRACECHURCH STREET, E.C.

Tuition Free to Shorthand Writers on application at Office. Telephone No. 11,821.

TREES IN FRENCH CITIES.

THE United States Consul at Bordeaux, in a recent report, says that one of the chief beauties of the larger French cities, and second only to their edifices and monuments, are the trees. The almost interminable vistas of chestnuts and acacias stretching along the broad and well-paved avenues as far as the eye can reach, their bending branches almost touching one another in an endless arch of verdure, form not only a delightful perspective for the eye, but serve to add beauty to cities already beautiful, and grace and symmetry to whatever might be harsh and forbidding. This, however, is not the result of nature's handiwork alone, for science and art have lent their aid. The planting, as well as the maintenance of the trees in French cities, is an item of no little importance in the annual budget prepared by the municipal council, which does not look upon their preservation as of less consequence than the repairing of the roadways or the lighting of the streets. The climate and soil of France are not suited to the nurture and growth of every tree, so that those chosen to line the avenues and boulevards of the cities must be selected with no little judgment. Chestnuts thrive wonderfully. They grow well on a not too rich or generous soil, but require at the same time frequent watering at the roots. Elms are also favourites with the professional landscape gardeners, though they are, unfortunately, extremely susceptible to destruction by worms and insects. Maples grow slowly, but they are hardy and strong. Add to these the acacia, the linden, the sycamore, the oak, and the buttonwood, and the list of trees that live and thrive to advantage in the great Continental cities is nearly complete. France imports a great many of her fruit as well as shade trees, and the utmost care is taken where they shall be planted. Handfuls of earth from every place where a tree is to be placed are carefully examined and analysed. Upon ground rich and moist trees from the United States grow best. A sandy soil is most favourable to resinous trunks, and so on. In squares and parks, though more especially along the principal thoroughfares, where the trees are planted about 20 feet apart, particular attention is given to the replacing of the dead or dying by healthy trees of the same species. In this way the line of perspective is never broken, nor is the eye repelled by the absence of a single trunk. One reason for the great care which the French bestow upon their arteries of traffic is that the nation, as a whole, spends, whenever the weather permits, the best part of its leisure time in the open air. The

Frenchman looks upon the streets of his native city and the adornment of the same much as an Englishman or an American does upon the decoration of his house. "Charles Kingsley is authority for the statement that verdure is just as essential to life as air itself, and that the kitchen garden of the labourer goes as much to add a touch of sunshine to his moral being as a bunch of roses to an invalid or the Royal Park to the Queen of England. The proof of the theory, which is a truer one than may at first appear, is in the witnessing of the crowds of poor that flock in summer-time to any spot where grass and foliage exist. The French know this. They plant trees and lay out flower-beds in every available corner within their cities' boundaries, while the benefit wrought thereby is too self-evident to demand interpretation."

TRADE NOTES.

THE new Board Schools, Brecon, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

THE directors of the Clay Cross Water Company have instructed Mr. W. H. Radford, C.E., of Nottingham, to report as to the best method of increasing the pressure in the town, as to the advisability of relaying and enlarging service-main, as to the necessity for storage of water, and as to the present filtering arrangements.

A LOCAL GOVERNMENT BOARD inquiry was held at the Town Hall, Mold, to consider an application from the Local Board to borrow 4,500*l.* for the intercepting sewers and sewage disposal of Mold. Mr. W. H. Radford, C.E., of Nottingham, is the engineer of the scheme.

THE Accrington Gas and Water Company have deposited a Bill for power to raise further moneys "for the purposes of improving and extending their existing works for the supply of gas and water, and for the general purposes of their undertaking."

ADDITIONS have been made by Mr. E. Denison, cloth manufacturer, Westfield Mills, Yeadon, near Leeds, to his extensive works, which, being at the Guiseley end of the town, has been hitherto without a public timekeeper. Mr. Denison has built a clock tower in his extensions, and has fixed a first-class clock, showing the time on two 6-foot illuminated dials, and fitted with automatic gas apparatus, Lord Grimthorpe's gravity escape-

ment, compensated pendulum, and all the latest improvements, and will be lit up for the first time this week. The new clock has been made and fixed by Messrs. Potts & Sons, of Leeds, who made the Yeadon Church clock, fixed about forty years ago; Yeadon Town Hall clock, presented by Mr. J. Peate; Messrs. Brown & Brayshaw's mill clock; also the adjoining church clock at Guiseley, erected over forty years—the whole of which have gone well, and given every satisfaction.

WE learn that Messrs. John Gibbs & Son (warming and ventilating engineers, 27 South John Street, Liverpool) have just erected a heating apparatus, on their well-known "Improved Small-bore Pipe" hot-water system, in a large "timber drying-room" in Liverpool with excellent results, the proprietor now claiming to have the largest and best drying-room for timber in Liverpool. The furnace is constructed on an improved principle, whereby the awkward drop fire-bars are entirely done away with, still permitting of easy access for cleaning from the front; it can be fed either from the top or front as may be desired. We may say this firm are the inventors and proprietors of the well-known "Gibbs' Fireplace Lintel," for the prevention of smoky chimneys, while at the same time improving the construction of flues. This latter invention is well known to architects.

THE new Roman Catholic church now being erected at Tenby is being ventilated by the "Climax" Ventilating Co., Limited, of 15 Great George Street, Westminster, S.W., and 93 Hope Street, Glasgow, their patent, direct-acting ventilators being used for the extraction of vitiated air, the fresh air being admitted through improved inlets.

BUILDING AND BUILDERS.

THE Tontine Hotel, a large house at 9 Ardgowan Square, Greenock, is to be converted into a first-class hotel, for Mrs. Buchanan. The purchase was made privately, after the property had been put up to auction and found no bidders.

THE trustees of the Greenock Eye Infirmary have decided to erect a new eye infirmary suitable to the wants of Greenock and Port-Glasgow. A local gentlemen has agreed to supply the funds.

AT a meeting of the special committee of the Governors of Robert Gordon's College, Aberdeen, to consider the proposed extension and heating and ventilation of the buildings, Mr.

HILL'S PATENT LOCKS AND OTHER FITTINGS.

(Triple-Action Bolt.)

NOTICE.

Buyers should satisfy themselves that Goods offered by other Firms do not infringe Hill's Patent Rights.

JAMES HILL & CO., 100^A Queen Victoria St., London, E.C.

Marr, architect, submitted the plan and specification for the heating and ventilation, which showed that, along with the extension of the buildings, an outlay of nearly 8,000*l.* would be incurred. The cost of the extension, without the heating and ventilation, was estimated at nearly 5,000*l.* The consideration was deferred.

IN accordance with a wish expressed by Mr. James Williamson, M.P., who recently paid in to the credit of the new infirmary fund at Lancaster the sum of 5,000*l.*, the committee have decided to proceed forthwith to erect the building upon modified plans at a cost of about 17,000*l.* The president, Mr. W. Smith, M.P., has undertaken to erect the children's ward, for which 1,000*l.* will be required. Towards the total cost between 12,000*l.* and 13,000*l.* has been raised or promised.

AT the meeting of the Bridgnorth Town Council, the special committee appointed to consider the question of providing dwellings under the provisions of the Working Classes Act 1890, reported that a public conference had been held with the working-men, and the eligibility of several sites was also discussed. The working-men delegates had selected a set of plans, and expressed a desire that any dwellings provided should have not less than three bedrooms (with separate access), two living-rooms (or parlour and kitchen), with detached washhouse; also a passage at back of premises between each portion of dwellings, and as much garden as possible, for a total rental not to exceed 3*s.* 6*d.* per week. The committee had agreed to submit the selected plans to the borough surveyor for his report and amendment, and had also instructed him to prepare for the committee's guidance an approximate estimate for the erection on one of the sites of twelve dwellings in three blocks of four. The report was adopted.

A NEW nurses' home has been proposed for the Leeds Workhouse Infirmary at Burmantofts. The scheme is now assuming definite shape. It was decided to erect on ground adjacent to the infirmary a building to accommodate from 30 to 40 nurses. There will be a general dayroom, private sitting-rooms for the matron and assistant matron, and a separate bedroom for each nurse. New receiving-wards are also to be erected near the entrance in Beckett Street. Mr. Winn is the architect.

MR. ROBERT DENNETT, of London and Nottingham, has accepted the presidency of the National Association of Master Builders of Great Britain for this year.

ELECTRICAL.

THE Bristol Electric Safety Lamp Works are carrying out the work of electric lighting of omnibuses, for the London General Omnibus Company. The battery weighs about 8 lbs. and is placed in a wooden box under one of the seats. The box is provided with two brass spring terminals which make automatic contact with the battery when it is let down into the box. The lamp is of a special manufacture and is made as small as possible to allow it being placed in the centre of the roof, and for the same reason the incandescent lamp is suspended horizontally instead of vertically. By this arrangement a maximum amount of light is obtained and risk of breakage is avoided. The batteries and lamps are made by the Bristol Electric Safety Lamp Works, 40 Great Smith Street, Westminster, and covered by their patents. About seventy busses have been lighted up to the present, and one hundred and forty were to be finished by the end of the past year.

It is proposed that the Dundee Harbour Board take into consideration the propriety of lighting the harbour and docks by electricity, and the desirableness of procuring an electric car to run from the West Station to the cattle depot.

THE Bewdley Town Council have appointed a committee to consider and report upon the desirability of utilising the power of the river Severn for electric lighting, and also for pumping water for domestic and street-watering purposes.

THE adjourned discussion on the report of the Electric Lighting Committee recommending the adoption of a scheme for the introduction of the high-tension system for private supply and deferring for the present the question of lighting the streets with electricity was resumed at the meeting of the Cheltenham Town Council. An amendment referring the matter back to the committee, with a request that they should take further professional opinion upon the scheme recommended by the committee on the advice of Mr. Hall (borough surveyor) and Professor Ayrton, was adopted.

THE Heckmondwike Local Board of Health have adopted a recommendation of the Electric Lighting Committee, to empower the clerk to take the necessary steps for obtaining permission of the Board of Trade and the Local Government Board to their electric lighting scheme.

PROGRESS is being made towards the lighting of Scarborough by electricity. A site has been decided upon for the erection of the works, the company having purchased two acres

capable of the most artistic treatment

of land situated in Beaconsfield Street and Salisbury Street, off Seamer Road. The plans are being proceeded with, Messrs. Hall & Tugwell being the architects.

It is proposed that the Runcorn Commissioners appoint a committee to inquire as to the probable cost and practicability of securing an installation of the electric light for the public streets of Runcorn, and to report to the Board at the earliest opportunity.

VARIETIES.

THE Withington Local Board have arranged the purchase of 11 acres of land from Lord Egerton of Tatton for the establishment of a cemetery and the erection of a refuse-destroyer at Withington. Lord Egerton has intimated his intention of presenting to the Local Board two plots of land in Withington, and two in Chorlton-cum-Hardy, for the purpose of recreation.

THE residents at Banchory, N.B., are enjoying an immunity from frozen pipes. Owing to the continuous frost they allowed their water-taps to run all night, with the result that the water has run nearly all out of the reservoir. The public wells are all dry.

AT the meeting of the Islington Board of Guardians a letter was read from the Local Government Board informing the Guardians that they were of the opinion that the proposal of the Guardians to erect a new infirmary on the Tollington Park site would be the best solution of the difficulty to provide adequate and proper accommodation for the sick poor of the parish. The Board assented to the purchase of the site.

A CONVERSAZIONE was held on Tuesday evening, the 3rd inst., at the Archbishop's House, Westminster, to consider a proposal for promoting an Exhibition of Christian Art, to be housed in temporary buildings to be erected in Westminster upon the vacant ground set apart for the future Roman Catholic cathedral. A paper giving an outline of the proposal was read by Mr. Charles T. Gatty. A resolution, proposed by Mr. Gatty and seconded by the Duke of Norfolk, was unanimously passed asking the Archbishop, who presided, to promote the Exhibition.

THE Southport Town Council have rejected the 15,000*l.* scheme for developing the foreshore, and adopted instead an enlarged scheme estimated to cost 20,000*l.* on the first outlay. This scheme embraces an outer marine drive and the joining of the two marine lakes to form a 50-acre sheet for boating and

bathing, the lake to be crossed by a five-span bridge. The new drive will be 24 feet wide, with a footpath on the seaside, and it is contemplated to add an electric tramway, electric works being about to be constructed.

THE Manchester Town Clerk has received a letter from the Local Government Board stating that they are not prepared to sanction the loan of 60,000*l.* for the purchase of the Rampton Manor estate by the City Council for the disposal of sewage.

THE Hornsey Local Board have passed a resolution stating that the alienation of the Alexandra Park and Palace for building purposes would be a lasting injury to the northern suburbs as well as to the metropolis generally, and have expressed their willingness to contribute the sum of 25,000*l.* towards the purchase of the park for the public use. The proposed purchase price is 275,000*l.*

AN inquiry has been held by the Local Government Board into an application by the Local Board of Haverhill to borrow 8,400*l.* for works of water supply, and 1,800*l.* for street improvements. No objection to the proposal of the Board was made.

AT a meeting of the Council of the Tramways Institute of Great Britain and Ireland, held at the Queen's Hotel, Birmingham, Mr. Carruthers-Wain presiding, a discussion took place on the construction and maintenance of permanent way, and a paper was read by Mr. A. Dickinson on the "Overhead Electric Traction Installation in South Staffordshire" just opened.

THE next ordinary general meeting of the Surveyors Institution will be held on Monday, January 9, when papers will be read by Mr. P. D. Tuckett, entitled "A Short Explanation of the Proposed Bi-metallism as affecting British Interests," and Mr. A. Goddard, on "The Currency Question and Land."

AT the meeting of the Worcester City Council it was resolved to increase the filtering area at the waterworks by constructing three additional filters, at an estimated cost of 4,500*l.*, repayable in thirty years.

THE *Leeds Mercury* says a strong room has just been opened in the new Joint-Stock Bank in Park Row, Leeds. This is designed to give absolute security against fire, thieves and falling buildings. On the outside are firebricks, in the inside a lining of steel half an inch in thickness, and between the two 18 inches of solid concrete, in which the iron ribs of the structure are embedded. The door is of great thickness, but that is not its most remarkable feature. The most ingenious

MANSION HOUSE BUILDINGS, 4 QUEEN VICTORIA STREET, E.C.

cracksman would be lucky if he discovered within a week the twists and turns by which it is made to withdraw its numerous and heavy bolts. Then the making of the keys would probably engage his attention another week. Nor would this be all. When he had got the door opened, he would have a no less difficult task in getting beyond the ponderous steel bars which form an additional barrier. But before he attempted this, electric bells would have announced his presence, and ere he was aware of his danger he would wish that he had not attempted so foolish an exploit.

THE Aston Local Board have sanctioned plans and specifications for the making of Sandy Lane and Thimble Mill Lane, at an estimated cost of 1,750*l.*, and that application be made to the Local Government Board for a loan. They also approved of plans for another theatre at Aston Cross, subject to satisfactory provision being made for ingress and egress.

THE following officers of the Aberdeen Granite Association have been elected:—President, Mr. William Boddie; vice-president, Mr. William A. Stewart; treasurer, Mr. Alexander Wilson; delegate, Mr. James McIntosh; directors, Messrs. John Donald, John Dunn, W. Edwards, R. Gibb, James Hunter, James Pope; secretary, Mr. James S. Jeffrey.

NOTES ON NOVELTIES.

Merrill's Patent Flush Tank and Trough Closet.—

These have been designed with the object of providing a thoroughly reliable automatic flushing closet, without the drawbacks hitherto experienced in consequence of the fouling of the trough from defective formation and from the failure of the flush tank. Merrill's tank has neither air-holes nor small pipes, which, as was proved by the Sheffield Corporation trials, wherever present, choke up and stop the action. It is self-trapping, and untraps at the end of every flush, will work equally well with clean or dirty water, and when used with waste water for flushing drains requires no grease-trap. The action is as follows:—There is placed below the tank a tumbler or tipping-bucket, into which the long leg of the syphon dips, reaching nearly to the bottom. When the water in the cistern rises to the bend of the syphon it runs down the long leg into the tumbler, thus trapping the syphon and confining the air contained in it. As a consequence the water in the cistern rises above the bend of the syphon in about the same proportion as in the tumbler. When the tank is filled the

tumbler also is filled to its tipping-point, and it discharges its contents, unsealing the syphon, which is instantaneously charged by the head of water in the cistern. The tumbler remains tipped until the finish of flush, when the air passes up the syphon, effectually unsyphoning it, thus dispensing with the usual leak-off holes or small syphons. The Sheffield trials proved that this tank could not be put out of order without actual destruction, and was thus reported upon by Mr. G. Alsing, A.M.I.C.E., and Dr. Harvey Littlejohn, medical officer of health:—"The only cistern which came absolutely scatheless out of the several tests to which they were subjected was that of the Water Carriage Engineering Company, which never failed to flush under any conditions, and which moreover is from its construction extremely unlikely to get out of order, or admit of its being easily tampered with. We are therefore of opinion that of all the cisterns which we have subjected to observation, this one is the most reliable in every way, and that under all ordinary conditions it can be depended on to act automatically and with regularity."—Sheffield Corporation report. The trough is egg-shaped, and has a straight back and front which gives the flush the greatest scouring power. The rear is set well back from the seat to escape fouling. As a result of this method of construction a considerable depth of water is retained in the trough, and the flush rises nearly to the top of the trough. The before-mentioned report of the Sheffield Corporation says of this:—"The form of trough which undoubtedly seems to us to be most favourable to a good flush is a triangular one, as exemplified in the two examples of the Water Carriage Engineering Company. By adopting this form a minimum quantity of water reaches a maximum amount of surface, or in other words, with the same volume of water as in the other forms, less surface liable to be soiled remains unaffected by the flush." They are manufactured by the Water Carriage Engineering Company, Limited, Sheffield.

BUILDING TRADES.

THE *Glasgow Herald* says the building trades have been unusually active during the past year. Not since the failure of the City Bank have wages been so high as now. Specially does this remark apply to masons and bricklayers. Locally these branches have been brisker than others in consequence of the large number of public works—railway, &c.—now in progress;

and besides these there are the new asylums in course of erection by the boards of the city, the barony, the Govan, and by the county at Hartwood. These are all large mason jobs, and they have made masons really scarce. Wages have consequently risen, and at some jobs fully 2*l.* per week has been paid for the services of a journeyman mason. Bricklayers have been able to command as high wages as masons. Joiners have not been quite so well off. The lull in shipbuilding always sends a large number of ship-joiners into the building trade, and, therefore, labour in that department has not been so scarce. Plasterers and plumbers have been very busy, especially the latter; the action of the health committee, in forcing the adoption of sanitary arrangements to a large number of old houses, has created quite a boom among plumbers. The other branches of the trade have been fully employed, and shared the general prosperity. House-building has been active, and received a spurt in consequence of the promotion by the Corporation of the New Buildings Regulation Bill. Just before the Bill became law, the Dean of Guild Court was crowded with new plans for dwelling-houses.

In connection with the building trade, the following table shows the linings granted by the Dean of Guild Court during the year, along with the estimated valuations:—

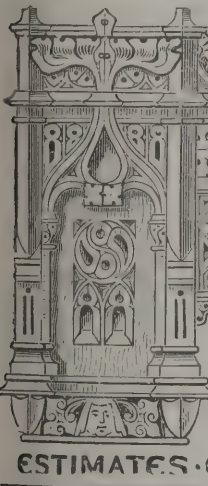

Nature of Application.	No. of Warrants.	Valuation.
Churches, halls, schools, and other buildings for public purposes, with alterations thereon	4	£33,750
Warehouses, offices, workshops, stables, byres, &c., and alterations thereon ...	110	254,750
Alterations on shops and dwelling-house property, with additions thereto	314	172,840
New buildings for shops and dwelling-houses	112	445,400
	540	£906,740

Any comparison with the previous year would be misleading in so far as regards these statistics, as they include all the districts added to the city on November 1, 1891, the statistics of which previous to that date we have not got. But it may be stated that any increase within the boundaries of the city previous to that date can be accounted for in the increase of applications for the construction of water-closets and internal alterations upon dwelling-house property necessitated by the Police Amendment Act of 1890.

During the past year the building trade of Edinburgh has been steadily prosperous, a decline noticeable in the winter months being natural and inevitable, and affording no symptom of an impending dulness. There has been little friction between masters and workmen, and wages have risen in several of the branches of the trade without resort to the method which during the year has wrought such havoc in other industries elsewhere. The masons who now, like the joiners, possess a Conciliation Board, were in May granted a rise of $\frac{1}{4}$ *d.* per hour, which brought the wage to the standard of 1891—viz., 8 $\frac{1}{4}$ *d.* The standard for joiners is now 7 $\frac{3}{4}$ *d.*, an increase of $\frac{1}{4}$ *d.* having been given six months ago, while plasterers have throughout the twelve months enjoyed the extra $\frac{1}{4}$ *d.* an hour, bringing their wage to 8*d.*, which was obtained in January last. Plumbers also have risen $\frac{1}{4}$ *d.*, their standard wage being 7 $\frac{1}{2}$ *d.*, and painters and decorators have earned good wages, varying from 7 $\frac{1}{2}$ *d.*, the standard figure, to 10*d.* and 1*s.* per hour for ordinary work, and from 9 $\frac{1}{2}$ *d.* to as much as 1*s.* 4*d.* for overtime. The wages agreement between masons and their employers will be reconsidered in May 1893. It is satisfactory to report that the trade activity has not to any considerable extent been due to the speculative building which was so

BAYSWATER, W.

prevalent a few years ago, and which of course was succeeded by reaction and depression. There was a decrease on the number of warrants granted by the Dean of Guild Court for house property of a first-class character, but the total number of warrants showed an increase, a goodly proportion being for alterations on existing buildings. A great part of the employment in the trade was, however, due to warrants granted in previous years for such undertakings as the M'Ewan Hall, which still engages a large staff of men, although quickly approaching completion. The building is a piece of magnificent workmanship, and when the thoroughfare improvements in its neighbourhood for which the Corporation have made provision take place, it will be possible to regard it as an architectural monument of which the citizens have reason to be proud. At present, hemmed in as it is by buildings of an inferior kind, it is impossible to get more than a glimpse of its outlines. The station works promoted by both the railway companies have been pushed forward rapidly. The new Caledonian Railway Station will be finished in the early months of the year, and is already so far completed as to allow the carriage stands to be used. The North British Railway alterations and extensions are, of course, of a different character, but a good deal of work has been provided for masons in the construction of retaining walls. Another work at the western extremity of Princes Street, the re-erection of St. Cuthbert's Parish Church has made rapid progress. The only portion of the old structure which remains is the steeple, and it appears rather dwarf-like attached to a building which, Dr. Macgregor says, will be, when completed, the largest parish church in Scotland. One of the buildings begun and finished during the year was the Empire Theatre on the site of Newsome's Circus. A structure of a more important character, at which over a hundred men are employed, is the National Observatory on the Blackford Hill. The contract price is over 30,000*l.*, and the work will not be ended for over two years. Other contracts which either have given or continue to give employment to large bodies of workmen are the extension of the General Post Office, the new police station in Gayfield Square, additions to the North British Distillery and Biscuit Works in the western portion of the city, the Scottish Wholesale Co-operative Company's roller-mills at Chancelot, the new bank premises in Cockburn Street, the Corporation refuse-destructor at Powderhall, a new U.P. church in Polworth Gardens, the additions to George Watson's Colleges for boys and girls and the extension of the Royal Infirmary. The last-mentioned is a very important work, upon

which it is in contemplation to spend a large sum. House-building operations have gone forward satisfactorily, especially in the southern suburbs of the city. The Morningside district is steadily developing in popularity. At the point about which it joins the trading portion of the city, the villas that a few years ago were so numerous and so closely sequestered from the vulgar gaze by walls and plantations have been entirely obliterated by huge tenements or are about to undergo that process. At the opposite extremity of the district villas of a smaller size have sprung up, and as the rents are moderate and the train and tram communication with the town is sufficient, there is but little unlet property. In the Newington district there has also been a good deal of building, including several business premises. Efforts have been made to procure a railway station on the line of the circular route in the neighbourhood of Cameron Toll, but they have not yet been successful. Meanwhile there are some important works in this locality, and it is believed that with better railway communication there would be a considerable amount of feuing possible. In the other portions of the city, beyond the large undertakings already referred to, operations have been of an ordinary character, though mention may be made of a tenement in Ramsey Gardens which Professor Geddes, who is well known for his views on the housing of the poor, is erecting. For the coming year the outlook may not be so bright as builders would like, but it is not destitute of promise. The recent fire in Princes Street having demolished a large building, another of no doubt more imposing dimensions will shortly be begun. Then the erection of the Sick Children's Hospital, the reconstruction of the County Buildings, the extension of the Royal Infirmary, a Board school for the south-western district and the new place of worship for Morningside Free Church congregation will provide work for a large number, besides the undertakings which are still on hand and others that the future always succeeds in discovering.

THE PROPOSED CHANNEL BRIDGE AND RAILWAY.

THE Bill promoted by a company which has in view the ultimate construction of a bridge or viaduct over the English Channel, with a railway thereon, has been deposited in the Private Bill Office of the House of Commons. It contains 13 clauses, and merely asks Parliament to empower the company, "either alone or jointly with any other companies, Govern-

ments, associations, bodies, or persons," to procure surveys and make soundings under the bed of the Straits of Dover below low water mark, for the purpose of ascertaining and determining the practicability of making, and maintaining a bridge or viaduct over the English Channel as a means of communication by steam locomotion or otherwise between England and France. The Bill contains no clauses to enable the company to raise any money to carry out these experimental works, but power is sought in the most general terms to enable the company to enter into agreements with the South-Eastern and London, Chatham and Dover Railway Companies, with the Dover Harbour Board, "or any other companies, Governments, associations, or bodies."

BUILDINGS IN BIRMINGHAM, &c., IN 1892.

MR. F. W. LLOYD, the Birmingham City Building Surveyor, has furnished the following return of new buildings, &c., for which plans were approved during the year ended December 31, 1892, together with a summary of the three previous years :—

	1892.	1891.	1890.	1889.
Houses and shops	1,491	966	1,061	938
Business premises	22	36	65	18
Manufactories, warehouses and shopping	199	183	179	163
Churches	1	0	0	2
Chapels	2	0	2	0
Schools	1	3	3	3
Miscellaneous	230	214	185	211
Alterations and additions	205	139	213	195
	2,151	1,541	1,708	1,530

It will be seen that, with the exception of business premises, under which head are included large retail establishments, hotels, &c., there is a steady increase all round ; the dwelling-houses and shops being over 500 more than the same item in 1891, and include two additional blocks of artisans' dwellings built by the Corporation in Lawrence Street. There is only one church, viz. Church of England, St. Oswald's Road, Small Heath. The chapels are :—Friends' Meeting House, St. James's Road and George Road, and a Mission Chapel in

Kelynge Street. The one school is St. Mary's Roman Catholic, Lonsdale Road, Harborne. Amongst the miscellaneous are Church of England Mission Hall, Park Road, Harborne ; New Free Library, Small Heath ; Assembly Rooms, Stratford Road ; Midland Railway Offices, Suffolk Street ; Kyrle Society's Hall, Sheep Street ; Dogs' Home, Fazeley Street ; and new Police Offices, Corporation Street. The alterations and additions include additional class-rooms and new cookery and laundry school, St. Thomas's Church, Bath Row ; enlargement of Congregational Chapel, Francis Road ; additional chancel, &c., St. Catherine's Roman Catholic Church, Horse Fair ; extension of Mason College, Edmund Street ; extension of Volunteer Drill Hall, Thorpe Street ; and alterations and additions to Dental Hospital, Newhall Street. From the above return it would appear that the past year has been one of much activity with all branches of the building trades in the city, especially if the prolonged strike of bricklayers and bricklayers' labourers in the early part of the year is taken into consideration. During the year 935 notices have been forwarded to property-owners and others as to dangerous buildings, projecting signs, emblems, &c. ; and a quantity of land, amounting to 144 superficial yards, has been conceded to the Corporation by owners of property setting back projecting windows, steps and other projections. During the same period 275 factories have been examined in accordance with the provisions of the Factory and Workshop Act, 1891, as to the means of egress for the employes in the case of fire. Of these 174 have since been altered, and are now provided with satisfactory means of egress, and the necessary alterations are at present in progress at forty-eight other factories.

The Bolton Chronicle says :—Whatever fluctuations characterise the industrial career of this town and the surrounding district during the period between one Christmastide and its successor, one feature is always prominent—the development of building operations. Including the completion of undertakings previously commenced, and the work still on hand by Boltonian architects and builders, the record of structural extensions and renovations during the past twelve months forms a big total, their great variety being also something to be noticed. We have had enlargements of cotton mills and manufactories, the erection of new Board schools, and the renovation of other educational institutions, the construction of buildings for commercial, trading, religious and many other purposes which the enterprise or the ingenuity of this progressive age suggests. Annexed details furnished by the respec-

tive architects and builders show to a great extent the progress made with regard to building undertakings in Bolton and the surrounding locality during the year.

THE EMPLOYERS' LIABILITY ACT IN SCOTLAND.

A CASE was heard last week in the Court of Session, Edinburgh, which exemplifies the contradictory evidence which is becoming common in cases under the Employers' Liability Act. The plaintiff was employed by Messrs. Henderson & Pollock, who in last March were carrying out the contract for the Water of Leith purification scheme. The plaintiff stated that he was assisting at the handles of a crane lowering pipes from the road under the Dean Bridge to the bed of the river, and when one of the pipes was being lowered over the embankment the jib of the crane gave a sudden and violent jerk, in consequence of which a part of the socket of the sole of the crane, in which the pivot worked, was wrenched up and broken, and the lower strap which fastened the westmost crane stays to the ground snapped, and the crane fell down. In consequence of the fall of the crane he was knocked over the embankment and fell into the bed of the river, a distance of about 30 feet, sustaining severe injuries. The accident was attributed to the crane being unfit and insufficient for the purposes to which it was applied. The contractors maintained that the crane was in all respects well fitted for the work, and that the accident arose from a latent defect in the strap, for which they were not responsible.

The Lord Justice-Clerk said it was a case in which the evidence upon the one side and the other presented perhaps as extraordinary contrasts as had ever been seen in a jury Court. For example, this crane was said to have been working regularly for four or five weeks before the accident. On the other hand, some witnesses stated that it was only working for two days, and only now and again, to raise and lower the pipes. Then they were told by people who were working the crane that they never saw Sturrock the manager oiling it. On the other hand, Sturrock said that he oiled it every day. They were told that it was never inspected during all the time it was there, and Sturrock told them that he inspected it every day as part of his duty, while it was also part of the evidence for the defence that if a crane of this kind was inspected when it was put up, it did not require to be examined for other twelve months. Some witnesses said that the crane worked stiffly and with jerks; others said that there was no stiffness, and that it never jerked

at all. Some witnesses said that the accident happened when the crane was being slewed round; others said that the slewing was finished, and that it came down when in the act of lowering the pipe down to its bed. Some of the witnesses said that at the time it came down there was a very sudden jerk, one of them saying he was thrown against the wall, while Sturrock, who was present, said that it came down "quite canny." Then, when they came to an examination of the crane, some witnesses said that there was a distinct crack in the sole-plate, which, it was evident, had been there before the accident, because it was not fresh; others said that they examined it with care, and that there was no such crack after the accident, and that all the break there was was absolutely fresh; while the manager told them that he had made a chip in it some time before, and that that chip must have been there at the time the accident took place. The chip had not, perhaps, weakened the crane, but it was visible, whilst many of the witnesses said that they saw no such thing. Lastly, as regards the strap, they were told by people who examined it immediately after the accident that they saw an old crack in it, red with rust, coming to the outside. Other witnesses told them that there was no crack coming to the outside, that there was no rust, but that there was inside, where it could not be seen, a flaw which some of them said was shown by a black mark. Others said it was shown by a mark which looked like red sand. So from beginning to end there was in this case the most absolute contradiction and conflict between the witnesses on both sides, and, therefore, it was a case in which the jury would have to do their best to get at what was a true and reasonable result. It was entirely and essentially a jury question, in which there was no real question of law involved at all.

After an absence of a quarter of an hour, the jury returned with a verdict for the pursuer, and assessing the damages at 150*l*.

THE SARDINIAN CHAPEL, LONDON.

THE clergy of the old Roman Catholic Church of St. Anselm and St. Cecilia, Lincoln's Inn Fields, which for upwards of two centuries has been known as "The Sardinian Chapel," have, it is said, received formal notice from the County Council that the site of that building will be wanted for the purpose of forming the new street from Holborn to the Strand, and that it will have to be removed. The building itself is of some historical interest, inasmuch as it dates from the year 1648, when it was

built in the rear of the mansion of the Sardinian Ambassador, which faced the south-western corner of Lincoln's Inn Fields. At that period, and for at least a century afterwards, the various ambassadors' chapels in London were the only places where the Roman Catholics of the metropolis could meet for their religious services, the erection of churches and chapels for that body being forbidden by law. Indeed, the use of the ambassadors' chapels by them was rather connived at than permitted. The chapel was partially wrecked by the mob in the Gordon Riots of 1780, but afterwards it was enlarged and to a great extent rebuilt. From that date down to about 1820, when St. Mary's, Moorfields, was built and opened, the Sardinian Chapel served as the headquarters of Roman Catholic worship and of the charities of that community, as it was near to the residence of the Bishop or Vicar Apostolic in Castle Street, Holborn, and also to the Freemasons' Tavern, where most of the public meetings were held for the agitation of "Roman Catholic Emancipation" in the early part of the present century. Erected under all sorts of difficulties, in a retired situation, and with a special view to the very reverse of display, the building has no sort of beauty or attractiveness, and many persons pass daily along Sardinia Street without even noticing that it is an ecclesiastical edifice. And yet down to the end of the reign of George III. it was the weekly resort of the Roman Catholic aristocracy on Sundays and holy-days of obligation, when the street in front of it was crowded by their carriages.

REGISTRATION OF PLUMBERS.

THE Lord Mayor presided at the quarterly Court of the Plumbers' Company at the Guildhall. A communication from the sub-committee of the Hornsey Divisional Committee of the Middlesex County Council on Technical Instruction was reported, stating that the County Council proposed to arrange for the holding of a class on plumbers' work at the Museum of Sanitary Appliances, established by the Hornsey Local Board at Highgate, and requesting the Plumbers' Company to nominate a teacher. The Court nominated Mr. Geo. Taylor, R.P.C., foreman to Messrs. Dent & Hellyer, as teacher. The Court also considered a communication from Professor W. R. Smith (director of the Laboratories of State Medicine), on behalf of the Governors of King's College, offering the use of workshops, lighted by electricity, and the physical and

chemical laboratories of the College for advanced technical instruction for plumbers in connection with the Company's educational scheme. On the motion of Sir Philip Magnus, a committee was appointed to prepare a scheme by which selected students from the metropolitan plumbing schools may have the opportunity of attending a course of advanced instruction at King's College. The Court also considered and approved a syllabus of technical lectures on sanitary plumbing, hot and cold water supply, and house drainage, to be delivered in connection with the Victoria University College, Liverpool, where classes for plumbers' apprentices are carried on under the direction of members of the United Operative Plumbers' Association of Great Britain and Ireland.

PSEUDO FIREPROOFING.

At the last monthly meeting of the Illinois Chapter of the American Institute of Architects, the results of the recent fire in the Chicago Athletic Club building were considered, and the information given is interesting as revealing the risks attending the use of detachable materials as a means of defence against flames.

Mr. Henry Ives Cobb, the architect of the building, said that perhaps the best way to bring the matter before the members was to briefly describe the structure, which is situated upon an inside lot with 80 feet frontage, 172 feet depth, and ten storeys in height, solid party walls on either side, and a front of blue Bedford limestone and brick. At the time of the fire the plastering was finished and the finishing well under way, and the contractors had used the gymnasium floor as a storage place for the hardwood lumber, some 70,000 feet being piled on this floor. In the storeys above was about the same amount of lumber that would be found in an ordinary fireproof building. The fire seemed to have started in the gymnasium and a number of other places at the same time. The woodwork in the upper floors was entirely consumed, but the fire did not go through the floors, but gained access through stairways and elevator shafts. In a general way the principal damage to the building was in the front, which is so far destroyed as to necessitate its rebuilding above the fourth storey. An interesting result was found in the fireproofing of the gymnasium floor where the fire was hottest. The first day the fireproofing was found to be in a generally good condition, but on following days the bottom member of the arches dropped off. It seemed to have lost its strength. The iron, where it was covered with fireproofing, was not damaged. The front of blue Bedford stone flew to pieces as soon as the water struck it. In the gymnasium, which was spanned by steel girders 40 feet long and 5 feet deep, special sections of the fireproofing dropped off the lower member, the tile breaking at the lower edge of the flange that held it to the girders, but these were not in any way damaged. The architect considered that the results proved that some system by which the tile could be tied in place by wire would be valuable. The fire was most intense in the gymnasium around the columns, where the fireproofing was destroyed, and in the dining-room where there was comparatively little fire the columns were in some cases left exposed. Above the gymnasium floor the building is changed in form to an I, the court walls being 15-inch, built in the ordinary steel

construction. These were more or less damaged. In the tennis court, which was lined with cement and contained steel columns, the cement was cracked, showing an expansion of the metal. In the front, where the 12-inch brick walls contained columns, no effect was noticed, showing that here the brick protected the columns. In the places where cement or lime was used the strength of both was killed. In the tennis court, where cement was used on the walls and laid with extraordinary care, being kept wet until the several courses were laid, it peeled off in courses. It was noticed that at the bottom of some columns where wire was used to secure the fireproofing, the material came off as in other places.

The water thrown on the material did serious damage, and it would have been better if the firemen had turned their attention to protecting the surrounding buildings and thrown no water into the building. While the fireproofing saved the building from being pulled to pieces by the expansion and contraction of the steel, it did not save itself, as shown by the disintegration and dropping of the bottom member under beams after the fire. It was probable that a large portion of the fireproofing would have to be renewed.

A member having asked Mr. Cobb if he would use the same system (terra cotta lumber) again, Mr. Cobb said he would, as he believed it to be as good as any fireproofing material, if not the best. It was a matter of regret that the several kinds of fireproofing were not used in the building, so that a comparative test might have been had. In the destruction of the fireproofing around columns, the speaker was of opinion that the water thrown on them penetrated to the air space behind the fireproofing (Z-bar columns were used), and formed gases which threw the protecting material off.

General Sooy-Smith said he went over the building very carefully the next morning after the fire. What struck him forcibly was that the heat was intense but of short duration, with the best possible draft at almost blow-pipe intensity. In the gymnasium the sections of fireproofing around the columns rested upon wooden blocks, which penetrated to the column. These were in some cases charred and in others completely burned out, and this may have caused the material to fall. One lesson taught is that fireproofing should be fireproof. They should select a fireproofing that in its manufacture is subjected to a heat more intense than any it can be subsequently subjected to in a building, and it is also necessary to devise a better method of securing it in place. The speaker endorsed Mr. Cobb's supposition that steam had generated behind the fire-

proofing on columns, and stated that it was apparent that wooden bands in connection with fireproofing around columns were out of place, and that if the metal is thoroughly protected a permanent building can be constructed by ordinary methods. In mercantile buildings excessive care should be taken in fireproofing. Architects will have to come to the using material for columns that is in itself fireproof, and he suggested this as a very interesting and profitable line of research, and that at least it will bring about a better system of fireproofing columns than that now employed. In regard to the stone used, while it was probable that no stone would resist fire and water, still some was much better than others. The speaker spent three days after the great fire in studying the effects of fire on stone, and the best stone he found was artificial stone. In one place he found this combined with limestone and sandstone. The limestone was totally destroyed, the sandstone was cracked, while the artificial stone was not much damaged. In fireproofing, what was needed was a system that would resist fire and still retain its stability. Columns must be homogeneous, or steam will form and throw off the fireproofing.

AN AMERICAN MONOLITH.

A GREAT brown-stone monolith will be among Wisconsin's contributions to the World's Fair. This obelisk claims the title of being the largest on earth. The work was commenced with five steam channellers and about forty men in August last, since which time the work has been pushed until the large pillar was worked out. Previous to the day of raising, the workmen at the quarry had carefully started the parting wedges, so that on the appointed day all that was necessary to complete the task Mr. Prentice had undertaken was the successful driving of the wedges. Along each side of the monolith, which had been sawed at either end, were about four hundred leather wedges, all partly driven. Arriving at the quarry, all that remained to be done was the giving of the signal to begin driving the wedges. There were fifty men on either side standing with mauls uplifted, waiting for the word to be given to tap the entered wedges. At a signal the mauls fell, and the work had begun. With the precision of clockwork the men drove the wedges, at each succeeding blow advancing to the next wedge. At last, with a slight quiver, the huge rock parted in its entirety from the mass and lay at the bottom of the pit ready to be delivered to the State Commission, to be trimmed

to the desired size. Mr. Prentice's first proposition to furnish the monolith was for a stone just a trifle larger than the Egyptian obelisk at Rome, said to be the largest in the world, which is 105 feet 7 inches, exclusive of the foundation, and 9 feet square at the base. He first intended the monolith to be 106 feet in length and 9 feet 2 inches at the base, but upon a later consideration decided to have it 115 feet long, 10 feet at the base and 4 feet square at the top. The apex will be about 5 feet long, and will be tapered to about a 6-inch tip. The entire monolith will rest upon a foundation of granite 10 feet high and 12 feet square.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

22772. Joseph Jones and John Rawson, for "A window sash-fastener and rattling preventer."

22850. James Price, William Henry Price, and Edwin John Price, for "Improvements in cocks and valves."

22895. Walter Brierley, for "Improvements in locks."

22924. The Co-operative Padlock Society, for "Improvements connected with the insertion of keys within locks and latches."

22979. James Moran, for "An improved automatic fire-escape."

22988. David Baron, for "A combined inlet and outlet ventilator."

23026. George Clarke, for "Improvements in stays for casements, fanlights and skylights, and for other like hinged articles."

23056. Thomas McKenzie, for "Improvements in chimney cowlings."

23111. Charles Darrah (of the firm of Baxendale & Co.), for "Improvements in hinges."

23175. "An improved device for mounting swinging mirrors, sash-frames, ventilators, and the like."

ELEVENTH ANNUAL
BUILDING EXHIBITION

Of all Industries connected with the
Building Trades,
MARCH 11 to 25, 1893.

"THE ARCHITECT" says of the 1892 Exhibi-
tion:—

"The representatives of all industries connected with the
building trades will be wise to commence at once their pre-
parations for the Exhibition. There cannot be as loud a pre-
liminary flourish about an Exhibition in Islington as there is
always about one of those designated as "international";
but if exhibitors will consider the results of the two classes,
they will discover that in the former they have met men of
business and received orders, while for the privilege of par-
ticipating in the universal shows they have not only lost
large sums, but discovered that the *Attendants* and holiday
makers, who constitute the mass of visitors, are not fasci-
nated by the best aids to construction.

JOHN BLACK, Secretary.

THE DENSMORE.**THE WORLD'S GREATEST TYPEWRITER.**

TO ARCHITECTS.—If you have come to the conclusion that the use of a Typewriter for writing your Specifications and Contracts will SAVE YOU TIME AND MONEY, give the DENSMORE a thirty days' trial before purchasing any other.

The Machine may then be returned if not found satisfactory in every respect, and a decided advance in typewriting mechanics.

If you decide to purchase it, we guarantee it free from all mechanical defects, and keep it in order for two years free of any charge.

TWO CARRIAGES, fitted with SOFT and HARD CYLINDERS, which are instantly INTERCHANGEABLE, are furnished with each Machine without extra charge—thus one DENSMORE performs the work of two ordinary machines.

NO LIFTING OF CARRIAGES REQUIRED IN ORDER TO SEE YOUR WORK.

If you require anything in Typewriting Supplies, give us a call and look over our stock. We have seventy-five different grades of Typewriting Papers and a large stock of the best Carbon Papers. Typewriting of all kinds neatly and promptly executed by a corps of skilled operators.

CHICAGO EXHIBITION NOTES.

THE American flag now floats from the Administration building at Jackson Park, to signify that the World's Fair buildings and grounds are in the possession of the United States Government.

ALL of the World's Fair offices, except two or three, are now removed to Jackson Park, and those will soon follow. For nearly two years the offices have been in the Rand-McNally building in the centre of the city. Now, however, the work of preparation of the great Fair has reached a stage requiring it to be carried on in the buildings which are to contain the exhibits. All of these buildings are now practically finished and ready for the installation of exhibits. Most of the work remaining to be done on the buildings is of a decorative nature and can be carried on and completed without interfering with the placing of exhibits.

In the Administration building, with Director-General Davis, are the offices of the departments of Foreign Affairs and Publicity and Promotion. The chiefs of the various exhibit departments—agriculture, electricity, mines, transportation, &c.—have their offices respectively in the great department buildings.

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 14 inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving. "ECLIPSE" PORTLAND CEMENT Quick setting; test, 3 parts. Standard Testing Sand, 230 lbs. per square inch; 28 days. The finest, most plastic, best sand carrying, and cheapest cement in the market. Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c.

Samples sufficient for Practical Tests Free. Manufactured by JOHN BOARD & CO., Dunball, Bridgwater.

ESTABLISHED 1844. NATURAL PORTLAND AND ROMAN CEMENTS, HYDRAULIC BLUE LIME, Plaster of Paris, Keene's and Parian Cements, Bricks, Roofing Tiles, Drain Pipes, Paving Tiles, Bath Bricks, &c. Railway and water communication.

THE installation of exhibits has already begun, but has not yet progressed far. Soon, however, the interior of each one of the buildings will be the scene of great activity. The authorities are determined to have all exhibits in place at the opening of the Fair, and manifestly this cannot be accomplished if exhibitors are allowed to be dilatory. It will not do to permit the great mass of exhibitors to defer installing their exhibits until April, and accordingly State and foreign commissions and individual exhibitors will be required to be prompt. Exhibitors who are dilatory beyond a certain point will lose their space and be barred out.

THE requirements of the preparation of the official catalogue of exhibits also necessitate promptness on the part of exhibitors. This catalogue will be an elaborate publication, and, generally speaking, will have a separate volume devoted to each department. It is the determination to have it on sale in complete condition on the opening day of the Fair, if it is possible to do so. That will, of course, depend mainly on the promptness of exhibitors.

UNDER the east windows of the occupied wing of the Administration building lies a scene like a creation of the Arabian Nights. It is the grand court, the main gateway to the World's Fair, the feature *par excellence* of the entire perfect plan of the Exhibition.

IN the centre ripples the blue waters of the great basin, which, while constantly renewed by Lake Michigan, is yet sheltered from the giant waves foaming on the open shore. The sky line on the east side—where the grey-blue horizon melts indistinguishably into the greyer blue of the lake and basin—is broken by the imposing pillared colonnade and the magnificent central arch of the peristyle. At either end stands the Music Hall and the Casino, disappearing in the soft misty haze behind the stately corner pavilion of the Manufacturers' building on the north, and on the south partially hidden by the graceful front of the Agricultural building. Above the dome of the latter the famous figure of Diana pirouettes with the shifting wind. This statue, being of heroic proportions and brilliantly gilded, is dazzlingly conspicuous amidst the prevailing white and grey of the landscape. Here and there, too, along the ornate fronts of these ivory palaces are rich, warm frescoes in mellow reds and yellows, painted under the direction of Millet, the artistic magician of the World's Fair. At the east end of the great basin stands French's grand statue of the Republic, lifting her shapely length 60 feet

from the pedestal, towering 90 feet above the waters of Lake Michigan. Opposite and immediately in front of the Administration building is the celebrated McMonnies fountain fast approaching completion. Columbia sits enthroned in the barque of Progress, heralded by Fame, and rowed by the geniuses of civilisation, while Time, representing experience, keeps a firm steady hand on the tiller. It is a strikingly beautiful and particularly spirited conception, the wind from the lake seeming to rustle the snowy drapery of the forward bent figures at the oars.

To the right and left of this workmen are toiling and machines are whirring within two balustraded semicircles, building the electrical fountains. These will give the finishing-touch to the scene of enchantment by throwing over it the light that never was on land or sea. Over the great basin, with its giant statues and its encircling columns and palaces of ivory and gold, will play these cloud-touching fountains of myriad, ever varying hue, tinging them in turn with violet, rose, blue, green, crimson or the mingled tints of the most resplendent rainbow.

By the time the Fair opens Chicago will have living accommodation for not less than 300,000 strangers. Connected with the exhibition management is a Bureau of Public Comfort, through the agency of which many thousands of visitors can be directed to hotels, apartments, boarding-houses, furnished rooms, &c., where they will be comfortably cared for at moderate prices.

OHIO will erect a mineral cabin in the Mines building at the World's Fair to illustrate its mineral resources. The cabin will be 32 feet by 61 feet in dimensions and 23 feet high, and be constructed entirely of Ohio mineral products.

THE section from one of the big California redwood trees, which the Government will exhibit in its building at the World's Fair, has arrived at the Fair grounds. Eleven freight cars were required to convey it across the continent. It measures 30 feet long by 23 feet in diameter. The section is hollowed out, and when placed on end, divided into two storeys and lighted, as it will be, it will form a rustic house large enough for a family to live in.

THE educational exhibit at the World's Fair is to have the space it requires. A new building costing 120,000 dols. has been ordered for the ethnological exhibit, which accordingly is thereby removed from the Manufacturers and Liberal Arts building, thus allowing more space for the educational exhibit.

BUILDING AND BUILDERS.

THE death is announced of Mr. W. White Phillips, builder, Hafod, well-known in the Rhondda. He was a member of the Llanwonno School Board, Pontypridd Local Board and Board of Guardians, and the Ystradfydwg and Pontypridd Joint Sewerage Boards.

AT the meeting of the Hamilton Dean of Guild Court proof was led in the petition by the Fiscal against Mr. John Tainsh, one of their number, for not carrying out the plans of alteration to his property as passed by the Court. When presented, the plans were, after being five times under consideration, dismissed, as Mr. Tainsh would not consent to remove part of the roof of his back yard for ventilation purposes. He then consented, and the plans were passed. Afterwards, he refused to remove the roof, stating that the Court, in so ordering him, had exceeded their powers. At the close of the evidence he was found guilty of a Guild offence, and ordained to carry out the alteration in conformity with the plans before March 1, and to pay 5s. of penalty and the expenses of the action. Mr. Tainsh intimated that he would suspend the judgment.

At the Board of Guardians meeting, Stratford-on-Avon, a letter was read from the Local Government Board on the proposed alterations at the workhouse. The Guardians had sent the plans as prepared by their architect, Mr. T. T. Allen, showing the provision of additional fire exits and various improvements in the sanitary arrangements of the casual wards, which were said to be in a "deplorable state." The Local Government Board returned the plans with a number of recommendations by their architect. The Board instructed Mr. Allen to amend the plans according to the suggestions made and submit them for final approval. Complaints were made of the great delay on the part of the Local Government Board in sanctioning the plans, the proposed work being of an urgent nature.

THE Dunfermline School contemplate building a technical school for about 350 students. Sketch plans have been prepared by Mr. Charles Tweedie, architect, Edinburgh, which provide for the use of the old Wilson School. The cost is estimated at about 4,500l.

THE subject of providing a new town hall came before the Workington Town Council, and it was resolved that the matter should be left to the Mayor's Committee to make all

necessary inquiries as to the probable cost of building a town hall, &c., and to report to a future meeting.

TRADE NOTES.

MESSRS. KEARNS have as usual produced their extensive series of diaries, which are specially prepared for the use of architects, contractors, &c. They are known to be so systematic that some day we may expect to hear the Courts recommend them for adoption in other classes of business, for anyone who will regularly utilise them to record his affairs cannot get into those difficulties which arise from unsystematic management. Messrs. Kearns do not, like many other publishers, depend on the external appearance of their diaries for success; they prefer to expend money on the inside, and paper and printing are as satisfactory as one can desire.

THOSE who have votes to bestow for the London Orphan Asylum, Watford, would do well to bestow their vote at this January election, which takes place on the 23rd inst., on T. C. Wilford, aged ten years, because on account of age it is the last opportunity for the boy. The father, a particularly respected and hardworking man, has left a wife and three children unprovided for, after two years of excessive suffering, during which he was entirely incapacitated for work. He served honourably under the Leicester Corporation, and was afterwards clerk of works to the London School Board, having been chosen out of some hundreds of applicants.

IN connection with Messrs. Archibald Smith & Stevens, we hear that one of their original pattern Smith's springs, which has been at work for thirty-five years on a City office door, was brought to them this week for repair. A comparatively slight renovation will start the veteran on a new course of service.

ON the 5th inst. Mr. Haden Tebb's sixth annual dinner took place at the Holborn Restaurant. Among those present were Mr. Haden Tebb (*père et fils*), Mr. T. H. Bolton, M.P., Mr. Everitt, Mr. Lewis, Mr. Harvey Prior, Mr. Slark, Mr. Horn, Mr. Rhodes, together with other representatives of the various professions.

A GULLEY-TRAP has lately been brought out by Mr. Couzens, of 14 Tudor Street, Cardiff, designed to prevent back-flow of tidal or storm-water, and also the escape of sewer-gas. The action is purely automatic, the ball abutting against the upper seating when water is in the trap, and falling on the

lower when empty, thus closing the trap in either case. Mr. Couzens has also another trap for the same purpose, in which the ball is dispensed with and a plate is employed to close the aperture. Both these arrangements have been patented in England and other countries, and there is every reason to believe that they will prove successful, and that their introduction will be a great benefit, especially to dwellers in seaport towns, in which great annoyance is frequently caused by high tides during storms or otherwise.

AN inquiry has been held by the Local Government Board at the Leighton Corn Exchange with regard to the Local Board's application to borrow 20,000*l.* for the purpose of sewerage, sewage disposal and water supply. A comprehensive account of the scheme was furnished by the engineer, Mr. H. Bertram Nichols, C.E., of Birmingham, who in his evidence stated that the water would be stored in a tank on a tower 81 feet above the ground-level of the highest house in the town. The purification of the sewage is proposed to be on the international process, and the site of the outfall for the sewage works was from the main road, and so situated that it could never prove an eyesore. On the termination of the inquiry, the inspector, accompanied by the Chairman of the Board and Mr. Nichols, the engineer, visited the waterworks site and the site for sewage disposal works.

MR. JOHN GRUNDY, of 30 Duncan Terrace, London, N. and the Tyldesley Ironworks, is now engaged in warming the following Board Schools:—Tottenham new Board School, Rochester new Board School, Hove new Board School, Brighton new Board School, Cobholm Island Board School and Tullynessle Board School. Several Board Schools have recently been opened where Mr. Grundy's warm-air ventilating apparatus has been, we are informed, employed with great success.

At a meeting of the Mersey and Irwell Joint Committee just held it was resolved to proceed with the action against the Whitefield Local Board for polluting the river Irwell. A further extension of time in which to construct sewage works was granted to a number of local authorities.

THE Kingston-on-Thames Town Council have resolved to invite tenders for lighting the borough with electric light. Sanction has been given to the borrowing of 1,600*l.* for the purpose.

THE shareholders of the Highland Railway at a meeting in Inverness unanimously approved of a Bill for the extension of

the line from Stromeferry to Kyle, a distance of a little over ten miles, for which the Government have given a grant of 45,000*l.*

THE City Commission of Sewers have passed a resolution in favour of widening the thoroughfare in Cheapside between Newgate Street and St. Paul's Churchyard, and instructed a committee to prepare a plan and report on the probable cost of the improvement.

THE Baths Committee of the Liverpool Corporation recommend that the Pierhead baths should be reconstructed, the expenditure to be limited to 15,000*l.*

THE Baths and Wash-houses Committee of the Leeds Corporation have decided to erect two swimming and hot baths, the first in Lemon Street, and the second near the Viaducts, in Kirkstall Road. The committee intended to visit Bradford and Dewsbury to see the baths there before advertising for tenders.

THE Wrexham Rural Sanitary Authority have adopted a scheme for the drainage of Ruabon village, prepared by Mr. A. C. Baugh, architect, Wrexham, which is expected to cost slightly over 6,000*l.* Mr. Baugh has adopted the Shone ejector system.

VERY fine work has been executed from time to time by Mr. W. J. Barnikel, staircase, handrail and general joinery maker, of Fulham. The following may be mentioned out of many others:—Staircase and handrail work at Messrs. Rylands & Sons' warehouse, Wood Street, City; at Pentonville and Wandsworth Prisons; grand staircase, royal box, Kempton Park, specially for the visit of the Prince of Wales and the Shah of Persia; for the whole of the Egerton Gardens Estate, opposite the Oratory, Brompton Road, including oak staircase at Sir Michael Seymour's house and special staircase at No. 31; at Ivy Hatch, Kent, and Imperial Bank, Lothbury; including sixty-three large windows, doors and other work now in hand for the Stafford Infirmary, under Mr. Aston Webb, architect, and Mr. Pebworth, clerk of works; handrail work at large block of offices, Bishopsgate Street, and at Cloth Fair, E.C., for Messrs. W. Brass & Son, Old Street.

FOR the illustration of their calendar for 1893 Messrs. Spottiswoode & Co. have copied a painting by Mr. A. H. Tourrier, the *Argument*. It is a capital specimen of chromo-printing which is well worth preservation, for the effect of the old-fashioned costumes and details has been produced without any of the glaring discords too common in modern work of the time.

FAWKNER, ROGERS & CO.

We beg to inform you that Mr. J. R. FAWKNER, who for the past fourteen years has held a responsible position in the London Works and Offices of Messrs. CROSSLEY BROS., Lim., original makers of the well-known "Otto" Gas Engine, has resigned his position to enter into partnership with Mr. HENRY J. ROGERS, M.I.M.E., under the above style, as Manufacturing Engineers, Electricians, and Founders.

The following are **SPECIALTIES**:—

GAS ENGINES.—Every Machine of Note will be found in our Showrooms. Special Oil for Gas Engines at Wholesale Prices.

ROGERS'S PATENT GAS WORKS.—For either Coal or Oil Distillation, erected for Public Buildings, Mansions, &c.

DAWSON'S LOW-PRESSURE STEAM HEATING.—Sole Agents for same. Absolute immunity from danger.

ELECTRIC LIGHTING & FITTING.—STATTER'S Dynamos, Motors, Fittings, Switches, &c.

PATENT VENTILATING FAN, &c., SHAFTING, PULLEYS, AND CASTINGS OF ALL DESCRIPTIONS.

These magnificent Showrooms are intended as a Dépôt where the buyer can find an ample selection of Machinery and accessories.

Works:—WATFORD. Offices and Showrooms:—11 & 12 NEW BRIDGE ST., LONDON, E.C.

"A WHITE LIE."

No ordinary success appears to have attended the first night's rendering of "A White Lie" at the Avenue Theatre on Saturday, the 7th inst., Mr. Kendal, manager; lessee, Mr. George Paget. "A White Lie" is an original comedy, in four acts, by Sydney Grundy, the characters being acted by Mr. Kendal, Mr. F. H. Macklin, Mr. Cecil M. York, Mr. G. P. Huntley, Mr. H. Deane, Miss Annie Irish, Miss Barbara Huntley, Miss Mary Clayton, Miss Empsie Bowman and Mrs. Kendal. New scenery has been painted by Mr. Harford, and the new fittings and furnishings, which are admirable, are the work of Messrs. Frank Giles & Co., of Kensington. Mr. and Mrs. Kendal, as it will be known, have only lately returned from America, where they achieved great success.

BRONZE STATUE OF THE QUEEN.

It will doubtless be of interest to the public to learn some details with reference to the bronze statue of Her Majesty, which is now placed in Whitehall for temporary exhibition, before being shipped for its final destination. The statue is the work of Signor Raggi, who received the order from the Hong Kong Jubilee Memorial Committee, it being determined by the principal inhabitants of that colony to mark their loyalty to Her Majesty and attachment to the mother country and fixed belief in the destiny of the British race, by placing an artistic memorial, in celebration of Her Majesty's jubilee, upon a prominent site in Hong Kong. Manifestly, nothing could be more appropriate than a statue representing Queen Victoria in her Imperial robes with the insignia of State. Designs were invited from a few artists of reputation, and from these Signor Raggi's was accepted as the best. It consists of a stone canopy, Renaissance style, about 75 feet high, under which the statue now on exhibition at Whitehall is to be placed, the stonework, which has been executed in England, having already been shipped to Hong Kong. It was, however, thought that so fine a work as the statue itself should not leave the country without giving the public an opportunity of judging of its merits. With this object in view, the Commissioner of Works, in conjunction with the Commissioner of Woods and Forests, have granted the temporary use of the corner of the vacant space where Carrington House once stood, thus offering a good opportunity to view this work of art.

The casting of this statue, which is of a most elaborate and

intricate nature, has been founded by the eminent firm of Messrs. H. Young & Co., Piccadilly, who also cast the colossal bronze sphinxes for Cleopatra's Needle, the Wellington Memorial in St. Paul's Cathedral, besides many other works by which they are well known in London and throughout the British possessions, and which have established them as bronze statue and art founders. Amongst the many works they have in hand is the equestrian statue of His Excellency the late commander-in-chief, General Dhir Shumshire Jung Rana Bahador (known as the Jewelled Prince), for the Nepal Government.

It should be a matter of regret to Londoners that the best art productions of this country are commissioned by our colonists.

WOOD-WORKING IN AMERICA.

THE progress made in the art of wood-working, writes Mr. C. R. Tompkins, M.E., in the *Engineering Magazine*, forms an essential feature of the mechanical inventions and improvements which have distinguished the past century. This art was probably one of the earliest practised by man, and its importance is shown by the fact of its continuing to exist under conditions of constant development. As civilisation has advanced, demanding in each stage more comfortable dwellings, the skill of the worker in wood has fully kept pace with the times. It is not necessary to go back of our own century to find evidence that progress in this art has been equal to that of any other branch of mechanical development.

There are parts of the Old World noted for the grand specimens of architecture in stone which have come down from the Middle Ages, but the slow and laborious processes of hand-labour by which those structures were erected rendered them so costly that none but the wealthiest could hope to secure more than the rudest and most primitive forms of dwellings. Our forefathers in the settlement of America, on account of the scarcity of suitable materials and the great cost of skilled labour, were obliged to be content with log cabins, which seem to have been the prevailing type of dwelling until wood-working machinery came into use.

The saw-mill was introduced soon after the settlement of the colonies, previous to which all the cutting of lumber into boards or planks, both in this country and in England, was performed by hand by the process known as pit-sawing. The log was placed upon a pair of saw-horses high enough to allow one man to stand beneath the log while the other stood upon

it, the two working a saw of sufficient length. Long after the introduction of the saw-mill, pit-sawing was practised in many shipyards, and most of the planking and other timbers used in a vessel were sawed in this manner. Improved machines and appliances for wood-working, as well as in every other mechanical industry, have always met with strong opposition from the ignorance, and want of foresight on the part of the working-men employed. When the first attempt was made to introduce the saw-mill in England, the hand-sawyers by their opposition practically placed a veto upon it. It is stated that in 1663 an enterprising company employed a Dutchman to erect a saw-mill in London, but that the enterprise had to be abandoned on account of the opposition of the hand-sawyers. In 1767 a saw-mill was erected and operated by a windmill at Limehouse, England, but it was soon destroyed by a mob. Another, erected in the south of Scotland about the same time, shared the same fate.

It is probable that the United States may justly claim the honour of being the first country to successfully introduce the saw-mill as an aid to the cutting of lumber. At least it was not until large quantities of sawed lumber had been exported by the Dutch from New York into England that the hand-sawyers would allow saw-mills to be erected in the latter country. There was less opposition to the saw-mills in America on account of the abundance of timber and the demand of the colonists for cheap lumber for building purposes, while the hand-sawyers were few in number and confined to the few shipyards. There was almost no attempt made to put hand-sawed lumber upon the market for building purposes. The saw-mill had the effect of rendering building materials cheaper and more plentiful, so that log-cabins in the principal towns soon began to give way to the more sightly and convenient framed structures. These, although an improvement upon the log cabin, were necessarily very plain, from the fact that no machinery aside from the saw-mill had been invented for dressing it. Consequently all the lumber used had to be dressed and fitted by slow and expensive hand-labour, and, except in the case of a few of the more wealthy, no attempt was made for improvement in either style or architecture until within comparatively recent years.

Next to the saw-mill, the most important machine that has been introduced, and one that has had more effect upon the progress of building than any other, is the planing-machine, which dates from the invention of William Woodworth, in 1826. Not only did the work of the planing-machine of itself

give a great impetus to the art of wood-working, but its introduction demonstrated that lumber could be dressed rapidly by the action of rotary cutters, leading inventors to apply the same principle to machines for other uses. The planing-machine may be considered as an American invention, although rotary cutters were used in England long before the Woodworth planer was invented. There is no record, however, that any successful planing-machine, with an automatic feed, was ever put upon the market for wood-working previous to that time.

The same spirit of opposition which manifested itself among the British hand-sawyers against the saw-mill appeared among the journeymen carpenters upon the introduction of the planing-machine. As soon as it was demonstrated that boards could be successfully planed and matched by machinery faster and more accurately than by hand, such excitement and indignation were expressed among the journeymen carpenters that the building in which the machine was located had to be watched day and night for months, lest it should be burned. The carpenters claimed that, if machines of that kind were allowed to come into general use, they would soon be thrown out of employment, and their families would suffer for the necessities of life. In some cities they refused to lay flooring that was planed and matched by machinery. But the planing-machine gradually worked its way into public favour, and the carpenters found that, instead of injuring their trade, it made more work for them, with less labour than before. Building soon began to increase, and it has continued to increase just in proportion as the materials have decreased in price through the aid of machinery, until it is doubtful whether a journeyman carpenter could be hired to plane and match hard wood flooring by hand, as carpenters were obliged to do in former years. The effect upon the wages of the journeyman carpenter is another proof that machinery has benefited instead of injuring their trade. If we go back fifty years, when all the materials of wood necessary for a building were dressed by hand, the average wages of the journeyman carpenter was about a dollar per day of twelve to fifteen hours. Now good journeymen carpenters in the cities find no trouble in obtaining from 2:50 dols. to 3 dols. per day of ten hours, while in some places nine hours constitute a working day.

While the introduction of the planing-machine effected a great change in the cost of dressing lumber, yet in the earliest form it was far from the perfection found in the modern machine. One objection to it was the imperfect manner in which the lumber was planed upon the ends of the boards,

there being no device, aside from the feed-rolls, for holding the ends down. Although they were placed as close to the cut of the knife as practicable, yet the distance from the centre of the roll to the cut of the knife was always from four to six inches. Consequently, when brought to the action of the cylinder knives, the end would lift from the bed and be shattered, so that several inches had to be cut off of the end of each board as waste. The invention of the chip-breaker—so called—was intended to remedy this fault, and it is applied now to all modern machines, not only to the cylinder but to the side cutters also, rendering the lumber both in the planing and matching as perfect upon the ends as in any other part. The chip-breaker consists of a small weighted roller or pressure-bar placed directly in front of the cylinder, so that the end of the board after it leaves the first pair of rolls is held firmly down to the bed until it passes the cylinder and is caught by the rolls directly behind. The beader is another improvement in wood-working appliances. The earlier wood-workers were satisfied with a machine that would simply plane and match, and where beaded ceiling was required the bead was struck by the carpenter with a hand-plane. But the progress in wood-working demanded a machine that would not only plane and match ceiling, but stick the bead also at the same operation, and the necessary devices for that purpose were soon invented, so that lumber now dressed at the mill is sent out in such a state of perfection that little or no hand labour is required aside from fitting it in its proper position in a building.

The moulding-machine, with its modern improvements, has had much to do with progress in wood-working. Before the invention of this useful machine all mouldings were worked by hand, and only the plainest and simplest style of mouldings were used, but the demand for more artistic wood-work has brought the improved moulding machine into general use. But still the demand for artistic wood-work continued, and it has led to the invention of many other complicated and useful machines. Not only intricate carved work, but irregular-shape mouldings of the most elaborate kind, which were formerly worked only by hand, are now produced by special machines which perform their work more accurately and in less time and more cheaply than hand-labour. This change has demanded not only more accurate and skilfully-constructed wood-working machines, but a more skilful and intelligent class of wood-workers to operate them. In machine-stuck mouldings especially there is a great change as compared with those stuck at the present time and those of a few years ago. Architects

and builders are far more exacting than they were formerly. Once they were satisfied with mouldings provided they were of the correct shape and of an even thickness, and, if the surface required smoothing down by the liberal use of sand-paper or sometimes the moderate use of a hand-plane, no objection was heard. Even with the imperfect state of the art the moulding-machine was far preferable to the hand.

Competition among machine manufacturers, and the desire of one to excel another in quantity and quality of work, together with the increasing demand of architects and builders for better machine-work and less hand-labour, has brought the moulding-machine to such a state of perfection that the most intricate designs in mouldings are now made both in hard and soft wood, so smooth that even the use of sand-paper may be dispensed with. This of course requires mechanical skill on the part of the wood-worker in order to keep the machine in perfect adjustment and the cutting tools in perfect order.

Probably no other branch of the art of wood-working has made more rapid advances than the manufacture of furniture by the use of machinery. It does not require a very old man to remember when most of the furniture was manufactured by hand, and the village cabinet-maker, who was also an undertaker, was an important personage. When a young couple were married, the cabinet-maker was called upon to furnish the necessary furniture for house-keeping; when baby was born, none but the cabinet-maker could furnish him with a suitable crib; and when death invaded the domicile, his services were again called into requisition to furnish a suitable casket and assist in consigning the body to its last resting-place. But the rapid progress in the art of wood-working has wrought a complete change. The village cabinet-shop has changed to the furniture store, and undertaking has become a distinct branch of business, the supplies in both cases being obtained from the factories, where machinery performs the work more cheaply and accurately than hand-labour. It is within comparatively recent years that the makers of wood-working machinery have turned their attention to the construction of machinery specially adapted to the manufacture of furniture. Formerly it was thought that the same class of machines used in planing-mills and sash and door-factories were also adapted to the manufacture of furniture. The use of such machinery tended to reduce materially the cost of production, but the pressure of competition in the furniture trade created a demand for better facilities in order to increase the output, while reducing the cost of production.

The band-sawing machine proved to be so much more rapid and better adapted to this class of work that it superseded the jig-saw, and the improved shaper—or, as it is sometimes called, the variety moulding-machine—was another that became indispensable to the furniture manufacturer. This machine is comparatively an old one, but it required many improvements to bring it to its present state of efficiency and adapt it to the varied requirements of the modern furniture manufacturer. With the special attachments, it has almost entirely superseded hand-labour in working irregular and curved shapes. The dovetailing machine is another illustration of the mechanical skill and inventive genius that the progress in the art of wood-working has brought into requisition. The perfection and rapidity of its work is such that with the labour of one intelligent operator the same quantity of work is performed in the same time that would be required by a half-dozen men by the old processes. Other special machines might be mentioned that have been introduced from time to time as the art has progressed, while manufacturers and inventors are constantly on the alert, so that no sooner does it become known that a new style of work is called for, than a new machine is brought out specially adapted for this special purpose. Thus in the present state of the art of wood-working little is left to be performed by hand.

We often hear predictions from a certain class of men that the advance in the art of wood-working, as well as in other mechanical branches, and the introduction of labour-saving machinery, will eventually reduce the wages of the workman. It is safe as a rule to judge the future by the past, and we have already seen that the introduction of labour-saving machines, so far as the building business is concerned, has not only increased the demand for skilled workmen, but more than doubled their wages for fewer hours of labour. What is true with the wood-working trades is equally true with every other branch of mechanics where skilled labour is required. As late as the year 1856 first-class machinists could be hired at 1.75 dols. per day, and the necessary machinery for a planing-mill or other wood-working establishment was little if any cheaper than at the present time, although there is nearly double the work upon a modern planing-machine that there was upon machines of that date. There is no question but with the present facilities a manufacturer would be able to put upon the market machines of the style of 1856 at much less than they were then sold for. Now machines of more than double the capacity of the former, with all modern improve-

ments and conveniences, are afforded at about the same figures that were charged for them forty years ago. While manufacturers are realising about the same profits as formerly, they are paying for the same class of skilled labour from 2.50 dols. to 3 dols. per day. This change has been brought about by the countless labour-saving devices that have been introduced into the modern machine-shop, whereby one man with less manual labour is enabled to turn out double the amount of work in a given time; still the market is not overstocked with first-class machinists. Therefore it does not appear that the introduction of labour-saving machines has had an injurious effect upon machinists' wages. The same rule will apply to every other branch of mechanical business. Experience has proved that the introduction of any mechanical device that will lessen the cost of production, and enable the producer to put upon the market an article at less price, or a superior article at the same, will in every instance increase the demand. Nowhere is this principle better exemplified than in the products of wood-working machinery.

THE ABERDEEN GRANITE TRADE.

ACCORDING to the *Aberdeen Free Press* the year just closed has been a year of very fair prosperity in the granite trade. The American export trade continues to be the chief branch of the Aberdeen monumental trade, and it is satisfactory to note that, in spite of the operation of the McKinley tariff, the American trade continues to develop. This is doubtless in some measure due to the great strike in America, but apart from that even, it is only what was to be expected. Some two years ago, when the imposition of the new tariff was in prospect, and when a slight tendency to alarm was shown by the Aberdeen granite manufacturers, it was urged in these columns that the new system need really have no terrors for them. It is true that the American trade shrank somewhat last year, but that was probably the natural reaction from the excessive fillip the trade previously underwent in prospect of the rise in the duty. This year, as indicated, the American trade has gone upward. And not only has it become the chief branch of the granite industry, but by far and away the chief branch of the Aberdeen-American export trade. During the year the value of finished granite exported to the United States from Aberdeen was far more than the value of all other articles of export put together;

for, while the total value of these articles—stationery, combs, fish, hides, herrings, breeding horses, linens, paper, woollen goods, whisky, &c.—was about 42,500*l.*, the value of granite monuments alone was about 67,000*l.* The rates accruing to the harbour of Aberdeen from the export of polished granite were 40*g.*, showing an increase of 62*g.* over the rates of the previous twelve months. It is only fair to remember that the credit of working up this important branch of local industry is less due to the local manufacturers than to the enterprise of the Americans themselves, who have sent over and established the agencies in the city that really carry on the trade. As evidence of the fact, it need only be mentioned that one, the oldest of these agencies, ships finished granite from the city to the value of about 450*g.* per week. While this is the present condition of the American trade, it is only right that manufacturers should know exactly what they have to face in the future. It is pretty clear that the Aberdeen American granite trade can only be maintained by the maintenance of the superiority of the Aberdeen material. It was the excellence of the Aberdeen granite, combined with undoubted excellence of workmanship, that gave this important branch of trade its rise. America now commands the most skilful workmen, and it is rapidly developing throughout the various States its own granite resources. Every year more granite is being utilised in the United States for monumental and decorative purposes, and in 1889—the statistics for which have only recently been published—the value of granite thus applied was 2,371,911 *dol.* It is evident, therefore, that if a superior stone does not continue to be sent from Aberdeen, America is not likely to go beyond her own borders for her granite supply. Other branches of the monumental trade have been fairly well maintained during the year. The Canadian trade is likely to rise in importance. It is being pushed chiefly by the American agents, and though yet far below the American trade in volume, being equal probably to less than one-sixth, it is full of promise as a field of operations in the future. The Australian trade, which has been growing slowly for the past few years, has received a momentary check from the imposition of an increased tariff by the colony of Victoria, backed by the flat condition of business in the country. A duty of 20 per cent. was previously imposed by Victoria—in which, of course, the chief Australian business was done—but in July last that was increased to 40 per cent., and along with the depression in business energy in the colony at present, that was too severe a strain not to be felt by the comparatively small Scotch granite

trade. The unfortunate thing about the matter is that New South Wales threatens to follow the example of Victoria, and in that case Sydney, with which some little business has been done during the year, may, like Melbourne, become pretty much a closed port to Aberdeen granite. Very little business has been done with South Africa during the year.

The home trade has been, if anything, somewhat steadier than during 1891. There has been an increase generally in the English trade—a fact that is chiefly accounted for by the growing demand for polished granite for building purposes. Many large contracts of this kind have been fulfilled during the year, and, indeed, there is a prospect that this may yet turn out to be a very much more important branch of the trade than it is at present. But, as already stated, though the volume of work has been increasing, the prices continue to show a downward tendency. Manufacturers complain greatly of the excessive keenness of competition, and urge—although perhaps in their extreme moments—that unless a change takes place some branches of the trade will not be worth following out. There is no doubt that prices are being cut to the very edge. The conditions of labour in the granite trade continue much the same as in 1891. Relations between the employers and the stone polishers were considerably disturbed in the early part of the year. The rupture began with resolutions of the Stone Polishers' Society—passed in the previous November—that the nine hours' day be demanded in all yards "on and after February 1," and that overtime be brought under certain restrictions. On February 9 twenty-eight Union polishers came out on strike, and on February 15 a general lock-out took place. Twenty-four yards were affected—two manufacturers, employing forty Union polishers, granting the demands of the men. Fully 300 men were idle during the lock-out, and the men resumed work without gaining their end on February 29. At the close of the lock-out thirty-two of the 280 members of the Union who were out failed to find employment, but they were all at work again within a month. After the strike time-work was largely introduced to all machine polishers, but the system has partly fallen through, and piece-work has again been adopted in various yards. The pay of the stone polishers averages from 4*d.* to 6*d.* per hour. An agreement as to the pay for overtime was come to in the middle of May. Overtime for the first 160 hours of work is paid for at the rate of time-and-quarter, after 160 hours time-and-half. At present six firms grant their polishers the nine hours' day, all the others work the ten hours. The relations between the employers and the operative masons and

stonecutters have been unruffled during the past twelve months. The Operative Stonecutters' Society is a particularly strong body, numbering 1,660 members, and to this fact is due perhaps the maintenance of a happy equilibrium during the year. The standard rate of pay continues, as in the previous year, to be 6½d. per hour for those stonecutters engaged in the monumental trade, and 7d. for those in the building line. The working of overtime was for a long time the bane of the granite trade, for masters and men alike, but matters have improved vastly in this respect in recent days. At the present time, largely owing to the operations of the men's society, although a little overtime is being worked in some of the smaller yards, practically none is being worked in yards of any importance. One of the features of the granite trade is the large number of stonecutters who, attracted by the higher pay, leave Aberdeen for the United States in the earlier months of the year. During 1892 about 120 men thus emigrated. Owing, however, to the break-out in May of the great strike in the American granite trade, which still in many parts drags its weary length along, emigration from Aberdeen was checked, and many of those who left the city soon found their way back. There are, and have been throughout the year, very few stonecutters out of employment. And it is satisfactory to be able to say that the outlook for the coming months for both masters and men is hopeful.

The importation of foreign granites has attained to large proportions, and it is bound to have an effect on the local quarrying industry. During the past year there has been landed at the Aberdeen quays from Norway and Sweden close on 7,000 tons of rough granite, representing a money value in rough stock of between 1,400*l.* and 1,500*l.* And the trade continues to increase as new varieties of foreign stone are discovered. The Aberdeen manufacturers, unable to find a sufficient supply of home material, tried the foreign granite a few years ago by way of an experiment. To-day the foreign granite is, in many cases, preferred to the local material. A German stone was first tried, but though large quantities were for a time wrought, it proved utterly unreliable, and has now disappeared from the market. The Swedish and Norwegian promises better, and as this is found in every variety of colour—red, and blue, and green, and black, and grey—it has certainly caught the public taste. It is very little, if any, cheaper than home granite, although there is not on it the same "sliding scale" as in the case of the home material, by which the cost of a block per foot rises in proportion to its size, but the foreign stone can be had in great abundance, and orders

may be executed in it with the greatest despatch. The importance of this, in the American trade especially, is very great, and as a consequence about two-thirds of the American orders are finished in Swedish and Norwegian granite, the rest of local stone. Within the last few months a new, well-coloured grey granite has been imported from Finland by Messrs. Stewart & Co., of the Bon-Accord Granite Works. Though slightly darker, it bears a close resemblance to Dyce granite. Two cargoes have been brought to Aberdeen already, and as the stone takes on a fine polish, it would probably share the demand of the other Continental stones but for the fact that the heavy cost of bringing it over is likely to stand in its way. Some little time ago attention was drawn to the Aberdeen granite trade by a statement by Mr. Carnegie, of Pittsburgh, that rough American granite was actually being brought to Aberdeen, made into monuments, and re-shipped to America. This is, indeed, a case of bringing coals to Newcastle, but all the same the statement was quite accurate, although the excuse would probably be urged that the system is worked on a very small scale. During the past year one or two deliveries, amounting in all to about an average cargo, of dark grey Quincy granite have been imported into Aberdeen and formed into monuments. Canada has hitherto been the destination of the finished work, but it is right to add that the granite has not been disposed of as "Aberdeen" granite.

DRAINAGE OF LONDON BOARD SCHOOLS.

THE magistrate at the Clerkenwell Police Court has given a decision in the case brought on summons against the London School Board by the Islington Vestry for permitting "two foul and defective 9-inch drains" to exist at their premises, the Verbury Road School, "it being necessary to remove the same and to substitute for them two 6-inch glazed stoneware pipe-drains." A second summons complained that the Board allowed drains to exist at the Hanover Street School which were in such a state as to be a nuisance or injurious to health.

Mr. Horace Smith, who visited the school, said that the School Board, upon receiving notice from the vestry, agreed to do some portion of the work required, but with respect to the drains, they decided, after taking proper advice, that they ought not to be called upon to incur a large expenditure for the sake of a doubtful benefit. He had come to the conclusion that both the drains in question were inefficient and were a nuisance

and injurious to health. He found as a fact that the 9-inch drain was laid in an improper manner. The gradient was irregular and insufficient, and the joints were so badly put together that they caused a leakage of sewage-matter into the soil. It was suggested by the School Board that, although the gradients were irregular, yet by a sufficiently frequent and ample flushing the drain might be left clear; but he found that even if a full flushing were regularly performed there was not sufficient power of flushing the 9-inch pipe. Even if a sufficient quantity of flushing could be obtained to cleanse such a drain, the leakage of the joints would still render the drain inefficient and would allow sewage to percolate into the soil. It had been further urged by the Board that, admitting that the drain was badly laid and that sewage-matter percolated into the soil, yet the soil was stiff London clay, and so no escape of gas would be possible. He would not decide whether a drain perfectly cased in London clay would be so secure as to prevent the possibility of the escape of sewage-gas, but the drain in question and also the 6-inch drain were not perfectly cased in clay, but were laid in a great measure in a soil of a varied character and quite capable of being percolated by sewage and by sewage-gas. It was further urged that the drains were some distance from the schoolrooms, and that the playground and schoolrooms were covered with a thick coating of tar-paving. He was of opinion, however, that it was far from impossible that sewage-gas should not reach as far as the school buildings, and that in case of the cracking of the surface at any time there would be great danger. That being the case there was also danger from the roof water-pipes which ran inside the school buildings becoming contaminated by reason of the percolations from the leakage of the badly-laid pipes; but if the drainage were made thoroughly efficient there would be no objection to the position of the roof water-pipes. The 6-inch pipe running from the caretaker's house appeared to leak throughout, and must be properly relaid and made watertight. He made an order for the abatement of the nuisance and a closing order prohibiting the school from being used until it had been made fit for habitation. Mr. Smith allowed the vestry 5*l.* 5*s.* costs. The second summons, in reference to the Hanover Street School, was adjourned *sine die*, as it was stated that the Board were doing the necessary work in that school. The magistrate was asked whether the Board were required, by his worship's decision, to relay both the pipes at the Yerbury Road School. Mr. Smith said that they were, because he found that the gradients were bad as well as the joints.

REGISTRATION OF PLUMBERS.

DR. TWEEDY, F.R.C.P., speaking on the occasion of the recent visit of the Lord Mayor of London to Dublin, and referring to an illuminated address presented to the Lord Mayor by the plumbers of Dublin and the district, said it was a great pleasure to him to be allowed to add a few words of welcome to the address which had just been presented. The local District Council for the National Registration of Plumbers had, in his opinion, acted very wisely in making itself as representative as possible. It had not confined itself to having among its members merely those connected with sanitary engineering, but had called in also members of other corporations to assist in its deliberations. This arrangement seemed to him particularly felicitous in the case of the Royal College of Physicians, which he had the honour to represent. That body had always had at heart the interests of technical education, and among the items now in the curriculum which had been introduced for perfecting the education of those engaged in their own particular profession were the subjects of hygiene, public health and preventive medicine, and in carrying out the practical details of that they were entirely dependent upon practical workers in sanitary engineering. The College of Physicians had also another bond of sympathy with this Association, and that was in the question of registration. Education was all very well in its way, but the test of an education being sound was by examination, and he rejoiced that this Association for the Registration of Plumbers was following up a sound and practical education by insisting upon the registration of all who chose to join the Association. It was a great pleasure to see the Lord Mayor of Dublin having as his guest the Lord Mayor of London, for there was fresh in the minds of some of them the gracious and genial reception which Mr. Alderman Knill gave as chairman of the Reception Committee of the great Sanitary Congress which assembled in London last year. He believed that the visit of the Lord Mayor of London would be productive of great and far-reaching results, and he was glad to hear that he was going to visit the young men actually at work.

The Corporation of Halifax have announced their intention not to appoint any plumbers as "Corporation authorised plumbers" unless they are upon the register of the Worshipful Company of Plumbers.

At the annual public meeting, recently held in Glasgow under the auspices of the Glasgow and West of Scotland

District Council for the National Registration of Plumbers, the District Council, in concluding their report, state that there is ample reason for satisfaction at the progress which the registration movement is making. The foregoing pages show that the value of national registration is becoming more and more apparent to all who have at heart the health of the community. The work which is being done in the direction of educating the younger members of the trade cannot but result in advantage to all concerned. With the aid of the expected Parliamentary measure, it may be predicted that in no long time every competent plumber will find it not only expedient, but necessary, to be upon the register, and the beneficial result of that will be seen alike in the protection of the public from the evils arising from insanitary conditions and in the advancement and elevation of the plumbers' honourable craft.

ELECTRIC LIGHTING IN ST. PANCRAS.

ACCORDING to a report by Mr. T. Eccleston Gibb, vestry clerk of St. Pancras, showing the success which has attended the installation by the vestry of the system of electric lighting applied to the south-western portion of the parish, the receipts from November 9, 1891, to November 8 last were 7,620*l.* 5*s.* 7*d.* and the working expenses 6,552*l.* 5*s.* 7*d.* Thus there was a balance towards the payment of interest on and repayment of loans of 1,068*l.* It is pointed out that the expenditure was upon a plant which for a large part of the time covered by the accounts was not doing a tithe of the work it was capable of performing. Last winter there were but few customers, and during the summer of course comparatively little light was needed. During October last, while yet the plant was not in full use, the receipts reached 1,023*l.* 5*s.* 2*d.* Upon this Mr. Gibb anticipates that the total annual income from this source will be, without any extension of plant, at least 10,000*l.*, and this, too, exclusive of the value of the current used for public lighting, representing about an additional 3,000*l.* Having regard to constantly increasing demands for current, and in order that plant now lying idle might be utilised, the vestry are advised to borrow a further 30,000*l.*, making the total capital for the present installation 100,000*l.* The vestry's expenditure compares favourably, Mr. Gibb says, with that of the principal electric companies. He goes on to say that it will be necessary before long to construct two other installations, involving a large increase of capital. In conclusion, Mr.

Gibb remarks on the advantages of electric lighting over gas, especially in regard to light, cost and risk from fire. Professor Robinson, consulting electrical engineer to the vestry, reports that one very probable means of diminishing the cost of production of electricity will be by adopting a system of "thermal storage," by which the boilers are worked continuously, and the heat generated during periods of little or no demand is stored up in water heated to a high temperature, at high pressure, for utilisation at the times of maximum demand.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

23736. Jonathan Hurn Faulkner, for "Improvements in and relating to coin-freed locks and mechanism."

23743. Constantine Henderson, for "A new or improved sash-fastener."

23749. Louis Jean Jacques Aubert, for "An implement for use in levelling or ascertaining gradients."

23829. Frederick de Jersey Clere, for "Improvements in the construction of window-sashes to facilitate cleaning and other purposes."

23884. Henry Leggott, for "Improvements in fire-grates."

23904. Thomas Fitch Rowland, for "Improvements in hydraulic elevators, lifts and the like."

23964. John Wilson Wright, for "Improvements in sash-fasteners."

24022. John Harrison, for "Improvements in sash-fasteners."

24033. Ernest William Beech, for "Improvements connected with locks and latches, also keys and handles for the same."

24164. Lucien Eilertsen, for "Improvements in or connected with cocks or valves for maintaining the water-level in steam boilers, and for other purposes."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

WINN'S PATENT

"ACME"

SYPHON CISTERN.

No. 1163.

Price, as drawn, 20*s.*; Galvanised, 28*s.*

Approved and authorised for use by the Birmingham Water Works authorities, and by all the London and leading Provincial Companies. Also now largely used in Barracks, Workhouses, and Her Majesty's Prisons throughout the country, and adopted by the leading Railway Companies, while more than 50,000 have been sold to the trade.

This flushing-box is suitable for any flushing-rim basin, but ESPECIALLY for Winn's Improved "Free-flushing" Basin and Trap, which has been designed to meet the want now generally felt for a good clean flushing-pan and trap constructed upon modern principles at a moderate cost, the price being 1*l.* for Cane and White, and 1*l.* 5*s.* for Cane Colour outside, and Ornamental Flower Ivy inside, a better quality, in superior Porcelain, being 1*l.* 10*s.* White and 2*l.* Ornamental.

—Specially suitable for all Patterns Wash-out Closets.

"THE ARTISANS', LABOURERS', AND GENERAL DWELLINGS COMPANY, LIMITED.

"84 Great George Street, London, S.W.: April 13, 1886.

"Messrs. Chas. Winn & Co., Birmingham.

"Dear Sirs,—We have about One Thousand of your PATENT ACME CISTERNS in use at Noel Park. They work most satisfactorily, and although somewhat exposed in external Water Closets, have sustained no injury from the severe weather of the past winter.—Yours truly,

(Signed) "R. E. FARRANT,

"Deputy Chairman and Managing Director."

THE DENSMORE.**THE WORLD'S GREATEST TYPEWRITER.**

TO ARCHITECTS.—If you have come to the conclusion that the use of a Typewriter for writing your Specifications and Contracts will SAVE YOU TIME AND MONEY, give the DENSMORE a thirty days' trial before purchasing any other.

The Machine may then be returned if not found satisfactory in every respect, and a decided advance in typewriting mechanics.

If you decide to purchase it, we guarantee it free from all mechanical defects, and keep it in order for two years free of any charge.

TWO CARRIAGES, fitted with SOFT and HARD CYLINDERS, which are instantly INTER-CHANGEABLE, are furnished with each Machine without extra charge—thus one DENSMORE performs the work of two ordinary machines.

NO LIFTING OF CARRIAGES REQUIRED IN ORDER TO SEE YOUR WORK.

If you require anything in Typewriting Supplies, give us a call and look over our stock. We have seventy-five different grades of Typewriting Papers and a large stock of the best Carbon Papers.

Typewriting of all kinds neatly and promptly executed by a corps of skilled operators.

The Densmore Typewriter Co., Ltd.
51 GRACECHURCH STREET, E.C.

ELEVENTH ANNUAL
BUILDING EXHIBITION

Of all Industries connected with the
Building Trades,

MARCH 11 to 25, 1893.

"THE ARCHITECT" says of the 1892 Exhibi-
tion:—

"The representatives of all industries connected with the
building trades will be wise to commence at once their pre-
parations for the Exhibition. There cannot be as loud a pre-
liminary flourish about an Exhibition in Islington as there is
always about one of those designated as "international";
but if exhibitors will consider the results of the two classes,
they will discover that in the former they have met men of
business and received orders, while for the privilege of par-
ticipating in the universal shows they have not only lost
large sums, but discovered that the dilettanti and holiday
makers, who constitute the mass of visitors, are not fasci-
nated by the best aids to construction."

JOHN BLACK, Secretary.

Exhibition Offices: 2 Newcastle Street, Strand.

TRADE NOTES.

To facilitate the execution of orders and despatch of goods, Messrs. Hobbs, Hart & Co. have found it necessary to remove their clerical staff to the registered offices of the company, which are adjoining their works at Arlington Street, Islington, N. The premises at 76 Cheapside will still be retained, and the greatly increased showroom space will enable the company to keep a much larger assortment of samples of their various manufactures.

As recurrence of frost is not improbable, the following communication may be useful. It comes from Mr. Thomas R. Macquoid. He says:—"Two years ago, in the severe frost of 1890-91, I called the attention of the public, through the *Daily News*, to the advantage of covering the lead water-pipes in houses with 'silicate cotton'—a non-conductor of cold—to avoid the horrible discomfort of 'bursts' in severe frost. Having suffered, I had my pipes covered in this way throughout the house, except at one point difficult of access. All my pipes except at that unsilicated point have kept sound during the hard frost we have been having. This, it seems to me, is a 'proof positive' of the utility of the precaution, and I again advise householders, where there is risk of bursting pipes, to have them covered with 'silicate cotton.' It is not expensive, and it is easy of application." The material is supplied by Messrs. Frederick Jones & Co., of Perren Street, London, N.W.

We notice that Mr. G. Shrewsbury, patentee and manufacturer of the "Calda" instantaneous water-heater, &c., has removed from 36 Gray's Inn Road to new premises, viz. the "Calda" Works, Station Road, Camberwell, S.E., where all communications must be addressed. Mr. Shrewsbury has also issued a new catalogue of gas conservatory boilers, the "Calda" instantaneous water-heater for gas or oil, improved gas baths,

cooking and heating-stoves, &c., which will be sent on application.

We hear from Mr. Rashleigh Phipps that statements have been published in some newspapers that the company known as Roger Dawson, Limited, has been formed to acquire the business of Rashleigh Phipps & Dawson, and he informs us that under the terms of the dissolution between himself and Mr. Dawson, the deed provides that neither shall use the name of the other in any shape or form whatever, and that he is now carrying on business at No. 102 Oxford Street, W., under the style of Rashleigh Phipps & Co., electric-light engineers and contractors.

The Agricultural College, Aspatria, is being warmed and ventilated by means of Shorland's patent Manchester grates and inlet panels, the same being supplied by Mr. E. H. Shorland, of Manchester.

At the meeting of the Wetherby Sanitary Authority, it was resolved to accept the tender of Messrs. T. & W. Marston, Otley, for the general drainage work connected with the Wetherby drainage scheme. Mr. Preston, Bradford, is engineer to the scheme. The question of borrowing the sum of 5,500*l.* for the work was postponed for a fortnight.

At the meeting of the Edinburgh Association of Science and Arts Mr. Duncan Bell read a paper entitled "Windows," in which he called the attention of the Society to the merits of a double-casement window, which, he said, was the most perfect yet introduced.

The Sewerage Committee of the Aberdeen Town Council have accepted the offer of Mr. Gair, contractor, to construct a sewer in Queen's Road for 290*l.*; and the offer of Mr. R. M'Kay for a new sewer in the Woodside district for 400*l.*

The first number of a new periodical, *The Writing Machine News*, published by the Yost Typewriter Company, Limited, has just appeared with the new year, the European edition being published at 40 Holborn Viaduct, E.C. The object of the journal, it is stated, is to concentrate and bring before Yost operators, users and students of the Yost machine, managers and agents of the company, such information as is likely to be interesting and helpful to them. The Yost Company in America have already brought out a similar journal for distribution there and in Canada, and this has been found of great service to its readers, by whom it is highly appreciated.

Owing to the immense success of "Charley's Aunt" and the great demand for seats, Mr. Penley finds the limits of the

BUILDING AND BUILDERS.

THE annual meeting of the Nottingham Master Builders' Association was held on Friday night, the 13th inst., Mr. J. W. Woodsend presiding. The following were elected to serve for the ensuing year:—Mr. J. W. Woodsend was elected president; Mr. George Fish, vice-president; members of committee, Messrs. J. J. Adams, J. Cooper, T. Cuthbert, C. Dennett, H. C. Gilbert, Enoch Hind, Joseph Hodson, F. Messem, R. Simpson, Councillor J. Wright, James Wright and F. Wartnaby. In the annual report the committee expressed regret that the year had been marked by slackness of trade, and the difficulties further increased by the demands of the operatives for higher wages, but ultimately an amicable settlement was arrived at. The committee have under consideration the revision of the schedule of day-work prices, and they recommend that the general contract form sanctioned by the Royal Institute of British Architects should in future be the only approved basis of contracts for the district. The number of members is steadily increasing. Votes of thanks to past officers for their services and to the Chairman for presiding terminated the proceedings.

THE Crewe Town Council have decided to purchase the Foresters' Arms Hotel and an adjoining shop in Earle Street from the North Cheshire Brewery Company as a site for the new Municipal Buildings. It is proposed to build a technical school as well as Corporation offices.

A PAPER will be read by Mr. William Shepherd at the Institute of Builders (Incorporated), 31 Bedford Street, Strand, W.C., on Wednesday, January 25, entitled, "Building and Engineering Works for Public Authorities."

A BUILDER of Plymouth, Mr. J. W. Parson, has just given a dinner at the King's Arms Hotel to his employes and a few friends. After the removal of the cloth Mr. Light rose to propose a toast which he thought would be drunk by everyone present with a hearty goodwill. Mr. Parson was a good employer, and as they had been friends for a number of years he could speak from experience. Mr. Parson, on rising to reply, said it afforded him very great pleasure to meet them there that evening, as he believed such meetings tended to improve the good feeling between employers and men.

THE Harrogate Town Council have instructed the Wells and Baths Committee to appoint a surveyor to take out quantities and to obtain tenders for the proposed new Montpellier Baths, as designed by Messrs. Baggallay & Bristowe.

A SITE has been taken for another new distillery in Dufftown by an influential firm of Glasgow whisky merchants. Mr. Donald M'Kay, builder, Dufftown, will erect the new buildings.

THE Plans Committee of the Aberdeen Town Council have passed the plans for the enlargement of Trinity Hall. The plans were prepared by Messrs. Brown & Watt, architects. The new building is designed to harmonise with the existing Tudor style. The additional accommodation on the hall floor consists of a minor hall, capable of accommodating 100 persons. The work is to be proceeded with as soon as tenders have been received.

OPERATIONS are about to commence for the erection of a new police station for the southern district of Glasgow. A site has been secured at the corner of Nicholson Street and Oxford Street, and designs for the building have been prepared by Mr. A. B. M'Donald, the city engineer. It is estimated that the total cost will be about 25,000/., and it is expected that the new station will be ready for occupation in two years.

ELECTRICAL.

At the meeting of the Coventry City Council the consideration of the General Works Committee's report on the question of electric traction for the Coventry and district tramways, which had been adjourned from the meeting a month ago, was resumed. The system proposed by Mr. W. S. Graff Baker, the owner of the tramways, is that known as the Thompson-Houston overhead-wire system, and a short sample of the wiring has been erected in Hertford Street. The Mayor moved the adoption of the report, which recommended the Corporation "not to consent to such a system in Coventry under any circumstances whatever." He believed that before long a better system would be introduced. This motion was not carried, and the matter was referred back to the committee.

THE deputation of the Edinburgh Town Council, who lately visited several towns in England with the view of gaining information as to the system of electric lighting, have draughted their report, which is to be printed for final approval.

THE New Romney Town Council have appointed a committee for the purpose of considering the expediency of lighting the town by means of electricity, the cost of gas being 5s. 10d. per 1,000 feet.

THE Heckmondwike Local Board decided at their meeting to advertise for an electrical engineer to carry out a scheme of lighting for the Board, the mover of the resolution expressing his belief that the scheme of Mr. Hutchinson, engineer, the adoption of which had been negatived, would not only be approved of when another engineer was called in, but would be commended.

The ceremony of turning on the current of the new installation of electric lighting in Hull has been performed. The station contains three boilers of the return tube pattern, made by Messrs. Davy, Paxman & Co., of Colchester. The water for these is supplied from the town mains, and passes through softeners into tanks, from which it is conveyed by feed pumps and injectors arranged in duplicate. By this means encrustation inside the boilers is reduced to a minimum. In the engine-room there two 200 and two 80 horse-power engines, each attached to a dynamo, from which a pressure of 110 volts will be obtained. When necessary, 115 to 120 volts will be got. The electric machines are made by Siemens Brothers. The street mines are laid under the footpaths, and generally consist of bare copper strips suspended and on insulators in little concrete tunnels. There are nearly three miles of culvert and pipes down, and the length of wire extends many miles. Messrs. Crompton & Co. have laid these mains. At night-time the station can be off and leave the batteries, the storage of which is in the upper floor, to supply the few lights which consumers keep burning at night. They are capable of supplying 900 lamps for one hour, or a proportionately less number for a longer time. The station at present is capable of supplying 4,500 16-candle power lamps.

VARIETIES.

THE Mersey Dock Board have decided to spend 40,500*l.* for providing additional accommodation at the Wallasey Foreign Animals Wharf.

A SCHEME for utilising the motive-power of the Rhone current at Bois Noir, near St. Maurice, has been devised by M. Barraud, engineer, Bex. He proposes to construct a flood gate and deviation canal furnishing a net motive-power of

13,000 horse-power. The cost of the undertaking is estimated at 1,800,000 francs.

MR. W. HOWARD SMITH, the city surveyor, Carlisle, is, the *Carlisle Journal* says, one of the "selected candidates" for the position of chief of the new department which the London County Council has established to carry out the large and important engineering and building works which they have in hand.

THE Stratford-on-Avon Rural Sanitary Authority have adopted a scheme of sewerage for Henley-in-Arden, for which they seek the approval of the Local Government Board and sanction to borrow 2,000*l.* to carry out the work.

THE medical officer, Dr. Hunt, in his report for 1892 to the Urban Sanitary Authority of Pudsey, says in regard of sewerage that there is no regular system. For the main part, the road sewers are of the old shallow, permeable, rubble, drain-sewer class. He desires especially to draw the attention of the Board to the urgent need for main sewerage that there is in the town. He also advocates that all the existing sanitary by-laws be revised and brought up to date, and that jerry-building be put down with a high hand, and without any fear or favour.

AT Cardiff a conference of representatives of the Severn Navigation mortgagees and of the Cardiff and Worcester Corporations has been held to consider the raising of 20,000*l.* for the alteration of Westgate Bridge, Gloucester, to a swing bridge, to allow of the better navigation of the Severn to the Midlands. A resolution in favour of altering the bridge, giving a clear head-room of 25 feet, was carried.

PLANS have been prepared for the Coventry City Council by Mr. James Mansergh for a sewage farm in the Avon Valley, with outfall sewer and other works, the estimated cost being 127,000*l.* It has been decided to take steps to acquire the land and carry out the work.

AT the meeting of the St. Pancras Vestry the names of the following six firms were brought up upon the recommendation of the General Purposes Committee for the appointment of quantity surveyors for the new Municipal Offices for the parish of St. Pancras, viz.:—Brunsden & Henderson, Corderoy & Farthing, Curtis & Sons, Gardiner, Son & Theobald, T. M. Rickman and Widnell & Trollope. On the final vote being taken the result was as follows:—Brunsden & Henderson, 46; Corderoy & Farthing, 30; T. M. Rickman, 6; and we understand Messrs. Brunsden & Henderson, surveyors, 47 Pall Mall, S.W., have accordingly been appointed for this work.

THE ACME WOOD FLOORING COMPANY, LD.,

Chief Office and Works:—Vauxhall Walk and Glasshouse Street, London, S.E.

AN inquiry has been held by the Local Government Board, at the Bradford Town Hall, into an application by the Town Council for sanction to borrow 33,753*l.*, money expended on the purchase of premises for street improvements already effected, and for sanction to borrow 15,000*l.* for other purchases during the next three years. Evidence was given as to the manner in which the 33,753*l.* had been expended, and the inquiry then concluded.

THE Bath Town Council at their meeting passed a resolution to the effect that the inconvenient and dangerous state of the present railway station was considered disgraceful to the city, and the Council hoped to receive an assurance of the speedy commencement of the work.

At the meeting of Greenock School Board, ex-Provost Campbell said he observed from the proposed Municipal Bill that powers were asked to borrow no less a sum than 145,833*l.*, and that practically no details were given of how it was to be expended. He thought the committee in charge of the matter should at once petition against the Bill.

WE hear that Messrs. Lumleys, of St. James's House, 22 St. James's Street, have for disposal a very fine building estate at Beaulieu, on the Mediterranean shores, a rapidly rising winter resort midway between Nice and Monte Carlo, and which bids fair to rival in popularity its better-known sisters on the Mediterranean littoral. The property in question is actually on the sea, and extends to some 30,000 square metres, and we understand it can be acquired at such a figure as should make it a very profitable speculation. It may be mentioned also that the property is about a mile from the Marquess of Salisbury's villa, La Bastide.

THE *Lincoln Chronicle* says:—The old wall to the north of the chapter-house, and that of the adjacent library staircase, which have been demolished in the last few days preparatory to the erection of a new staircase more in harmony with its present conspicuous position, have been found to contain a large number of exquisitely-worked architectural fragments. The greater part of these belong to the long-lost north walk of the cloister, consisting of window-tracery, mullions, capitals, &c., almost as fresh as the day they were first put up. Examination of the continuation of this wall at the back of the library proves that it contains similar fragments to a large extent, so that if the scheme for removing the library were carried into effect, the missing walk might be largely rebuilt with its original beautifully-carved stones. Some other fragments,

richly coloured with scarlet and azure, are shown by comparison with the existing work to have formed part of the original reredos.

THE LIABILITY OF SUB-CONTRACTORS.

A JUDGMENT has been issued by Sheriff Rutherford in an action for 100*l.* damages by John Balfour, engine-fitter, Lochee, near Dundee, against Messrs. Kinnear, Moodie & Co., builders and contractors, Iona Street, Edinburgh. On August 27 last, while on the public road between Dundee and Lochee, he was struck in passing under a railway bridge in course of alteration by a piece of iron or stone which fell from it and cut him on the head. The defendants were contractors with the Caledonian Railway Company for the alterations on the bridge, but they employed sub-contractors, and it was a squad employed by one of the latter that was working when the accident occurred. The Sheriff has decided that the defendants are not responsible for fault on the part of the sub-contractors or of any persons in their employment. He therefore finds for the defenders, with costs. In a note he says that defendants employed sub-contractors to produce a certain result, but they had no control over them with reference to the means by which that result was to be accomplished.

CARTAGE OF EXCAVATED MATERIAL.

IN excavations a contractor occasionally has the good fortune to strike upon a bed of sand or gravel which was not anticipated, and it rarely happens that he is not allowed to enjoy the whole advantage of the material. A case has occurred in Glasgow, and has given rise to litigation, which presents a rather novel claim that was founded on such a discovery. Mr. John Young obtained a contract for a section of the works on the Glasgow Central Railway, and in August 1890 he agreed with a firm of cartage contractors, named Young & Co., to carry material from the cuttings to a spoil-bank at the rate of 5*d.* per ton. Sand was found in 1891, and was sold by Mr. Young to builders, who removed it at their own expense and in their own carts. His cartage contractors claimed the monopoly of removing the stuff, but it was not allowed. In September 1891 a deep bed of sand was reached, and again the question arose whether Mr. Young was entitled to sell or store the sand without being bound to give Messrs. Young the cartage of it

Westminster Chambers, 5 Victoria Street, London, S.W.

They reasserted their claim to "the cartage of everything excavated." Mr. Young, while denying their right to this, proposed that they should cart all the sand that was intended for the store on time-payment, and when they refused he ordered off their carts and employed other carters. Messrs. Young thereupon brought an action for breach of contract, and claimed 1,500*l.* damages. Their agreement "to do the cartage of gravel, sand, &c., of the cutting of the new railway," it was maintained, gave them a right to remove all the material excavated. The Court decided against the carters. On appeal the judgment was upheld. It was laid down that there was nothing in the contract giving the plaintiffs right to the cartage of everything excavated, the contract rather being that they were to have the carting of what required to be carted, and that the defendant was the judge of the quantity. Scotch law does not correspond with what is followed in England. An English judge would be likely to arrive at an opposite decision. Apparently the intention of the parties was that the carters were to remove all the stuff from the cuttings, and if the sand, gravel, &c., caused extra inconvenience, the carters would have to take the risk. The discovery of the valuable beds of sand made the cartage unnecessary, for the purchasers used their own carts. But how could a general agreement be affected by a contingency that was not referred in any way?

CLAY, BRICKS AND BRICKMAKING.*

THE selection of a suitable clay is the first and most important step in the business of brick and tile making, the success of the business depending very greatly upon the selection made. A clay that will mix readily, dry and burn without cracking, uniting when burned, and forming a vitrified body, is much to be desired. It has often been remarked, and it is doubtless true, that there are no two samples of clay, taken from different clay beds, exactly alike. They may have the same colour and texture so far as we can judge, but yet they differ materially in some essential, though unknown, characteristics. Clay is a product of the decomposition of minerals largely aluminous in their composition. Such minerals must have been abundant in the early stages of geological formation.

* A paper by Mr. E. Parry, read before the Victorian Architectural and Engineering Association, and published in the *Australasian Builder*.

They entered largely into the composition of the great masses of granite rock, which by its disintegration or decomposition has furnished very much of the material of which all clay banks are made up. And as the rock in different localities would most probably be under different conditions of formation, so its composition and properties would vary, and hence the difference in apparently similar clays. Although there is some difference of opinion as to its chemical relation, we all know that water plays an important part in the practical adaptation of clay to its various uses. Acids will not displace it, nor will temperature below red heat disturb it. But above that point the clay becomes permanently hard, nor is it possible by any known process to replace the lost water and with it restore the plastic character of the clay. Let us now briefly consider the different varieties of clay.

Pure clays are those belonging to the coal measures. Nearly every bed of coal rests on what miners call "fire-clay." Some of these clays when found and brought to the surface are of a stony consistence, others are of a plastic nature. As a rule these clays have a light blue colour, caused by the dye from the coal, but become white on being kilned or burned, the carbon which gives the colour having been dissipated. Although the clay-beds differ very materially in appearance and composition we usually find the purest clays underlying the lowest coal seams. Yet these clays are not always free from impurities. In some districts soda in considerable quantities is found mixed with the clay; sometimes potash, rendering the clay fusible under a high heat and, therefore, unfit for either fire-bricks or terra cotta. It must also be mentioned that beds of clay suitable for fire-bricks and terra cotta are often found near the surface. In several parts of Victoria excellent clay has been found from which fire lumps and bricks have been made equal to those imported. Briefly, we have the Post Tertiary clays, or those connected with drift formation, and the alluvial or more recent origin. Drift clays are composed of two groups:—1. The tuff or lower blue. 2. The clays of the glacial period proper. These clays are found between rocks or resting on boulders and having gravel dispersed between them. An observer will notice this clay in railway cuttings, where the strata can easily be traced; and in slips where the clay will be found mixed with pebbles. This clay is generally mixed with fine sand, and sometimes a stratum of sand from one to four inches thick will be found running through it. The second of this group of clays consists of material washed from the last named by torrents of

water. From exposure to atmospheric influence the iron of these clays has been partially oxidised, and its blue colour changed to a dark yellow or light brown, which becomes a bright red when thoroughly burned. The third clay of alluvial or more recent origin is caused by the back-water of large streams arresting the muddy water of the smaller tributaries that comes down from the hills loaded with fine particles of clay.

We have seen, then, that extensive beds of clay exist in various parts of the world of diverse varied qualities. As the rocks which produce clay differ from one another in density, colour, quality and usefulness for various purposes, Webster's definition of clay may be quoted here, being short and to the purpose: "Clay is a soft earth which is plastic or may be moulded with the hands. It consists of alumina, the characterising ingredient to which it owes its plasticity, and silica with water; it is the result of the wearing down and decomposition, import of rocks containing aluminous material, such as granite, &c.; lime, magnesia, oxide of iron, and other ingredients are often present."

Turning our attention now to the subject of bricks and brick-making, we have enough evidence from recent discoveries in Rome, Egypt and other countries to prove that both brick and terra-cotta were made and largely used at a very early period in the history of the human race. Both burned and unburned bricks were employed in the construction of the Great Wall of China. This wall, one of the most remarkable fortifications ever erected by human hands, employed millions of men for the space of ten years in its construction, and was completed in the year 211 B.C. Its length was about 1,250 miles, the height averaging about 22 feet. Our most recent works of any note in which bricks were employed are the Thames Tunnel and the Great Western Railway tunnel under the river Severn. In the former 75,000,000 bricks were used. I sincerely wish that some similar work had to be constructed in Victoria, though I am afraid that if such were the case the authorities in their combined wisdom and sagacity would paralyse our hopes and expectations by preferring concrete to a colonially made brick. The commonest and worst bricks that have ever come under my observation were those made in London. This is not only caused by the nature of the clay used, but by the foolish use of ashes, and other objectionable ingredients, such as animal and vegetable matter, that are used; while from the mode of burning we can imagine—and some of us call to mind—the

intolerable and overpowering stench that the authorities seem to take such delight in, for the existence of such proceedings is a standing disgrace to any community that pretends to make health laws, and could only exist by the wicked connivance of those who possess the power of having the same removed. Our cousin, the American, naturally claims the honour of making the best brick—a brick that, like everything else American, is calculated to "lick creation"; but, in my humble opinion, the Staffordshire Blue or the Welsh Metallic takes the palm for strength and durability—(Staffordshire bricks 654 tons square feet, Welsh Metallic 1,056 square feet)—while Australia can lay claim to making a common building brick that will compare very favourably with our home products of similar nature; especially can this claim be made as regards the price—a not unimportant consideration at this time, or, in fact, at any time. Notwithstanding this fact, brickmakers do not receive that support that should be accorded them. They are, therefore, obliged to cut down prices so severely that disappointment to both maker and architect is too often the inevitable result—25s. per 1,000 for the best machine-made bricks is, at the same time, an absurdity and a disgrace.

What is most demanded in the use of brick, stone, or other material employed in the erection of buildings is:—1. A minimum of weight with the maximum of strength. 2. That the material used shall be unaffected by damp, cold, or heat, according to the variations of the atmosphere. 3. Durability, which can only be secured by the clay, or other leading constituent of the material, being perfectly calcined. Many so-called "hollow bricks" have been made, but they have, while securing a decrease of weight for economy in carriage, been but hollow mockeries and empty delusions, for in proportion to the cavities made in the brick, the resisting power has been reduced, and therefore weakened. In fact, after a part of the core, however small, has been taken out it has been impossible to put the brick through the hand or steam press, either of which would inevitably destroy the cavities. For this reason these bricks have had no closed ends and are thus useless where headers are necessary to complete the bond in courses. Many attempts have been made to bring this class of brick into general use in many parts of England, but up to the present without any success. We also have the wire-cut brick, which name I must admit is somewhat vague. The clay on being brought from the pit is either passed through rollers or perforated into the pug-mill, and from thence is forced, in the form of a continuous band of

HILL'S PATENT LOCKS AND OTHER FITTINGS.

Buyers should satisfy themselves that Goods offered by other firms do not infringe Hill's Patent Rights.

JAMES HILL & CO., 100^A Queen Victoria St., London, E.C.

about 9 inches wide, on to the cutting table, where by a hand-cutting machine having wire cutters it is sliced into sizes suitable for bricks. If the clay is strong, fair bricks can be made, but, on the whole, they are far from being satisfactory, as there is a tendency to twist in the process of drying and burning. Now let me say a few words upon the dry and semi-plastic bricks. Both these are made in Victoria, with a fair amount of success. The plastic process is the best for our clays, and gives by far the best results both in strength and colour, and bricks made by this process may be relied upon for durability, and are not affected by the many changes of climate.

I have been very much disappointed at seeing our best bricks, after being produced at great care and expense, in so many instances being covered over with plaster, for, to my mind, it shows bad judgment and still worse taste to prefer dismal stucco and crumbling plaster to the honest and straightforward countenance of a brick. This strange preference for plaster seems to me somewhat indicative of a discreditable shame for what is real and a love for the unreal. In other words, many would readily infer, from numbers of our public and other buildings, that the god we worship is the god of mere appearance, and that we are ashamed of our real selves. But there is comfort in this reflection that, if buildings indicate national traits, then underneath the show of stucco and plaster there is to be found good, substantial and honest brick.

That bricks are being viewed as ornament as well as objects of use is becoming more and more evident every day. The constantly increasing use of brick and terra cotta, says a New York writer, is "doing wonderful work for our once monotonous streets. The breaking up of the solid brown stone blocks, particularly on the avenues, lamentable as it is in some respects, since it is for building purposes, still has done much in this way. But the brick gives life and colour to a town which, taken in connection with more picturesque architecture, is making some areas to blossom like the rose, so to speak." The fashion of the day is architecture in the so-called Queen Anne, an attractive style, and one which certainly gives colour and picturesqueness to a street when honest red brick is employed instead of sham plaster or a thin and stingy veneering. "I go so far," says Mr. R. W. Edis, in the "Journal of the Society of Arts," "as to say that the man who builds a red brick house in town where want of colour tends to make everything glaring, or when smoke-coloured, gloomy, is a benefactor to his species." No materials are more suitable to the smoke

and deleterious action of the atmosphere of all great cities than building materials of clay. Warmth of colour and picturesqueness may both be obtained by the use of the numberless shades of red brick, whilst this range of colour may be greatly enlarged by the use of glazed and enamelled bricks, which, with the terra-cotta faience, admit of almost any variety of designs. The building world is happily finding out, at length, the value of clay building materials for durability as well as ornament; and American metropolitan streets promise to be in the near future more picturesque and beautiful in colour than ever before, with terra-cotta in its various shades, hard and glazed bricks, tile, &c., which every shower of rain will wash and clean and improve, and which will be bright and clean and beautiful when the sham fronts of stucco and veneering are ragged and ugly with age and decay.

Brickwork is acknowledged to be (except by some of our learned City Fathers) the best material for sewers and culverts, as earthenware is for drain-pipes. Perhaps the time will come, and we sincerely hope it is not far distant, when our gas and water mains will be of the same material. The ordinary spigot and faucet joint, properly bedded in cement, can be made both air and water tight, and if a screw joint were preferred it could be used with perfect safety. The chief advantages about earthenware for pipes of every description are that its glazed surface renders it non-absorbent, and favourable to the passage of water or soil, and also that it is absolutely non-corrosive. If our Metropolitan Board of Works could only be induced to use salt glazed bricks for the lining of the main sewers in our city, they would find that there would be neither fungus growth nor wear caused by the rush of water.

In many towns in England bricks have been employed for paving streets and footpaths, and the outlay has been acknowledged to be much below that of flagstone. Red bricks impart a very agreeable colour, and other tints might be used so as to form an agreeable pattern at a very slight expense. They can be cheaply and rapidly renewed when necessary, small portions of a footway being repaired at a time, so that traffic is not interrupted for long periods.

Ornamental bricks, in addition to being produced in the ordinary red colour, can also be manufactured in caustic colours, as buff, brown, chocolate brown, black, &c., and can also be enamelled in any desired hue, such as red, yellow, blue, green, &c. For ornamental bricks having caustic colours, the colouring oxides are mixed with the clay in quantities usually of 7 to 10 per cent. The colouring oxides act as fluxes, and

the composition of the body must be altered in some cases to counteract this. Ornamental bricks, like the ordinary pressed brick, are sometimes also coloured under the glaze.

GLASGOW FIRES IN 1892.

THE inspector of fires for Glasgow has just issued the annual report for the year ending December 31 last. The fire calls received and responded to were 591, while the brigade also attended 108 false alarms of fire. 577 of the fires were within and 14 beyond the municipal area. Engines and firemen were present at 370 of the fires within the city, but in 221 cases the outbreaks were of such a trifling character that firemen with hand-pumps only were sent out. While many of the city fires were of a sharp nature, and required the presence of a strong force of men and plant, yet only two of them have resulted in serious loss; these were the general workshop and warehouse buildings, 66 Mitchell Street, and Messrs. Hamilton, Caldwell & Co.'s Leather Currying Works, Boden Street, Bridgeton. The fires of 1892 show an increase of 56 in number as compared with the preceding year; but as 62 of the fires occurred in the districts included within the city in November, 1891, those within the old area show an increase of 24 over last year. The calls for services of the brigade outwith the city have diminished from 35 in 1891 to 14 in the year now reported on; but this also is in a large measure due to the extension of the city, as many of what were formerly "country fires" are now included in those of the enlarged city. Contacts on the line wires of street alarm system caused 8 false alarms, 76 were the result of mistaken judgment on the part of those ringing up the brigade, while in 24 instances the street-alarms were rung maliciously. Of the 577 city fires, no less than 203 were due to defective vents, flues, &c., and to timber under hearths. The average loss per fire within the city for three periods of five years, ending respectively with and including the years 1882, 1887 and 1892, may be worthy of passing notice. The loss for the first period was 243*l.* 18*s.*; for the second, 324*l.* 12*s.*; and for the third, 268*l.* 16*s.*; while the average loss per fire last year was 207*l.* 19*s.* 5*d.* The new stations at Mary Hill and Springburn are well advanced, and are expected to be ready for occupation early next summer. The central station is not suitable either for expeditious turning out or for the maintenance of proper supervision and discipline of the force stationed there. The house accommodation for the majority of the

members of the staff is very unsatisfactory. The locality is not one that would now be selected. As the most important work of the department lies in the centre of the city, it is desirable that the station should be so situated as to afford ready egress for the brigade, and so arranged and equipped as to make the work of the department attain a higher degree of efficiency than is attainable in the present station. The engines, hose-carriages and all other plant have been maintained in a thoroughly efficient state, and 2 hose carriages, with the necessary ladders, and 2 general purposes carriages, have been built by the staff; while three new steam fire-engines and 2 escapes have been acquired by purchase and added to the plant of the department. One of the steamers is to replace one purchased twenty-two years ago, which has been disposed of as unfit for service. 452 new fire-cocks and 32 new valve hydrants have been attached to the mains, these principally in the districts recently added to the city.

GRANITE INDUSTRY IN SCOTLAND.

THE Aberdeen *Free Press* gave a report of the annual social meeting of employes of the Great North of Scotland Granite Company, lately held in Prince Street Hall, Peterhead. Mr. W. Martin presided, and in the course of a short address said he thought it appropriate, if anything was to be said on that occasion, that it should be in regard to their work. As they were all aware, the work had been kept going very decently all the year. He did not think that they had anything to complain of as compared with others—in fact, nothing to complain of at all—in respect of being able to keep all hands employed. He was pleased to say that in that respect they were only in the same position as those of their own trade in Aberdeen. Wages, as they knew, had kept up; they had not risen, but they had not decreased. He did not know if the profits had been keeping up. He was looking forward to having a few days' work in order to find if the profits had been keeping up; but as he knew prices had been falling he was a little afraid of the result. However, he did not look forward to anything in the shape of a calamity; he had no doubt the company would be able to set the men agoing again at the beginning of the year, and he hoped to keep them going throughout the year. A year ago, about this time, they of the granite trade were talking of the M'Kinley tariff, which they were very much afraid would seriously affect the granite trade in Scotland. It was exceed-

ingly gratifying to say now, after a year's experience, that the trade had not been seriously affected. In spite of the enormous duty the Americans still bought from Scotland, and in larger quantities than ever. The output of granite from Aberdeen to America had been larger during 1892 than in any previous year, with the exception of the year when the M'Kinley tariff was looked forward to, when a special effort was made to take in quantities at the old price. The main reason for the trade having kept up—although that was not perhaps such a gratifying feature of the year's trade—was that foreign granite had been coming into very general use in America. They could not now take the Aberdeen grey granite across to America and pay the high tariff. Swedish and Norwegian granites were now worked largely in Aberdeen, the quantity worked there for the year being valued at between 7,000*l.* and 8,000*l.*, which was just about the value of the granite that passed over the Great North of Scotland Railway. The probability was that that trade would increase if the workmanship was kept up to a good standard; but there was a danger of it being sent to America in the rough state and worked there. That was a matter with which they as granite workers had to do. Peterhead, of course, did not touch the foreign granite, but they did not know what might happen. He was confident, however, that so long as Scotch workmen kept turning out a first-rate article the granite would be worked in Scotland; but if they did not keep on improving as years went on, he feared very much that the Scotch working of foreign granite would pass away. They had it in their own hands, and their young men should see that they learned their business in the most thorough way, so that they would be able to compete with any workmen in the world. If Scotchmen did not keep to the forefront as artisans the time was not far distant when the granite trade would be over; but if they kept their work well up there was very little fear but they would be able to maintain their trade. There was no immediate fear, and he had no doubt but that Scotchmen would rise to the occasion, and fit themselves to compete with Yankees, Germans, Norwegians or anybody. He hoped and he believed also that the employers would not be behind in the way of enterprise, so that they would be enabled to keep the granite-working trade in the district in which it had been brought to such perfection. There was a danger which threatened them in Peterhead, particularly if the Great North of Scotland Railway Company brought their branch line from Ellon to Boddam, and came no further, they would be placed at a very considerable disadvan-

tage. At present the Aberdeen people with whom they had to compete and they were on the same footing. They all took the granite from the same quarries. They in Peterhead, of course, worked it first, but they got no advantage of that because of the high rate they had to pay for carriage of the polished material. If this new railway were brought to Boddam the Aberdeen people would be able to save both in cartage and carriage, and they in Peterhead would thus be placed at a disadvantage. But if they were placed at this disadvantage they had got to equalise it, and as they would have a year at least to think about it, he did not think they should let themselves be put behind without a struggle. They might be all called upon to co-operate with the management, but he hoped and thought that they would be able to carry on in spite of the railway. If, however, the railway came to Peterhead, as it was to be hoped in the interest of the town it would, then they of the granite works would be as well off as they were before.

DR. E. FRANKLAND ON GASLIGHTING.*

DR. EDWARD FRANKLAND, whose researches were made first in the laboratories of Playfair, Bunsen, and Liebig, and afterwards at Queenwood, Owens College, St. Bartholomew's, the Royal Institution, and the Royal College of Chemistry, has left, in the same way that Davy did, his stamp upon all he attempted. Whether working upon the isolation and identification of the radicles of which organic compounds are built up, and the evolution from them of new and unknown compounds, or employed upon the more practical investigations on water, sewage and gas, with which his name is so closely identified, or in his studies on physical science, which served to make still pleasanter his vacations, Frankland threw into the researches his heart and soul, and has given us a record of work which is remarkable for the way in which he has not only disclosed to us new facts, but has attempted in every case to discover the principles underlying them.

In the August of 1859, Dr. Frankland, in company with Professor Tyndall, undertook an ascent of Mont Blanc, with the object of establishing thermometric stations between Chamouni and the summit of the mountain, and, at the same time, seized the opportunity of trying some experiments on the

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

PATENTED IN
England,
Belgium,
France,
Germany,
Italy.

TRADE MARK.

PATENTED IN
Austria-
Hungary,
Denmark,
United
States
of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 23, 1887.
I have had some trials made with the **KALLKOLITH** during the past few weeks, the results of which are very satisfactory. The **KALLKOLITH** is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale.
J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.
We are pleased to tell you that the **KALLKOLITH** supplied to us has been fairly tried, and we find that it answers all that you claim for it.

Address—E. STUTTARD, 88 ADELAIDE ROAD, BROCKLEY, LONDON, S.E.

rates of the combustion of candles at high altitudes, in order to verify the accuracy of a statement made by Le Conte, that "the process of combustion is retarded by diminution of the density of the air, whilst it is accelerated by its condensation."

Burning six candles for one hour at Chamouni, Dr. Frankland carefully noted the loss of weight for each, and again repeated the experiment for one hour on the summit of Mont Blanc. The average diminution in weight for each candle was 0.4 grams per hour when burnt at Chamouni and 0.2 when burnt on the summit of the mountain; and the close agreement of these results, under such widely differing circumstances, naturally suggested to his mind that the rate of burning of substances which require the oxygen of the air to support their combustion is entirely independent of the density of the atmosphere. Whilst watching the burning of the candles in the tent which had been erected on the summit of the mountain, Dr. Frankland was struck by the small amount of light which they emitted, and the way in which the non-luminous zone of the flame had extended its proportions to the detriment of the luminous zone. Later on in the year Dr. Frankland repeated these experiments under conditions which allowed of photometric measurement of the amount of light given by the candles under diminished pressure, and the results are best given in his own words:—

The result proved that a great reduction in illuminating effect ensues when a candle is transferred from air at the ordinary atmospheric pressure to rarefied air. At the same time remarkable changes in appearance occur in the flame itself, especially at high degrees of rarefaction. During the diminution of pressure down to half an atmosphere the chief alteration is the gradual invasion of the upper and luminous portion of the flame by the lower blue and non-luminous part. As the pressure sinks towards ten inches of mercury the retreat of the luminous portion of the flame towards the apex goes on uninterruptedly; but the shape and colour of the flame also begin to undergo very remarkable alterations—the summit becomes more and more rounded until at ten inches pressure the flame assumes nearly the form of an ellipse, while the blue portion, which now comprises nearly the whole flame, acquires a peculiar greenish tint. Finally, at six inches pressure, the last trace of yellow disappears from the summit of the flame, leaving an almost perfect globe of the peculiar greenish-blue tint above-mentioned. Just before the disappearance of the yellow portion of the flame there comes into view a splendid halo of pinkish light, forming a shell half an inch thick around the blue-green nucleus, and thus greatly enlarging the dimensions of the visible flame. The colour of this luminous shell closely resembles that first noted by Gassiot in the stratified electrical discharge passing through a nearly

vacuous tube containing a minute trace of nitrogen. The colour thus imparted to the electrical discharge undoubtedly constitutes the most delicate test of the presence of nitrogen. In both cases I believe the coloured light to be due to incandescent nitrogen. In attempting photometrical determinations with candles, it was found that, owing to the irregularities of combustion, no satisfactory quantitative experiments could be made in artificially rarefied air. Oil-lamps also proved equally unsuitable, owing to the gradual ascent of the base of the flame towards the apex of the wick, by which the size of the flame and the hourly consumption of the oil were greatly diminished. Recourse was therefore made to coal gas, which, although liable to certain minor disturbing influences, yet yielded results, during an extensive series of experiments, exhibiting sufficient uniformity to render them worthy of confidence.

From the results of these experiments Dr. Frankland deduced the following important law:—

Of 100 units of light emitted by a gas flame burning in air at a pressure of 30 inches of mercury, 5.1 units are extinguished by each diminution of one mercurial inch of atmospheric pressure, or, more generally, the diminution in illuminating power is directly proportional to the diminution in atmospheric pressure.

As a natural sequence to these experiments, he made a second series upon the effects of compressed air upon the luminosity of similar flames.

At the very outset of this part of the inquiry considerable difficulties presented themselves, since it became necessary to abandon a gaseous combustible, which could not be compressed to the necessary degree and then delivered at a uniform pressure through a burner without very complex apparatus. I was thus compelled to resort to solid or liquid combustibles, the irregularities of which were still further increased by the space within the combustion chamber being necessarily more confined, in order that its walls might the better sustain high pressures. These difficulties in the way of accurate determinations, however, were by no means the most formidable, for it was soon found that any considerable increase of atmospheric pressure caused both candle and oil-flames to throw off large quantities of fuliginous matter, the formation of which could not be prevented by any amount of draught that could be established in the chimney of the apparatus. Hence, although the luminosity of the flames was greatly increased, yet it was obviously much less so than would have been the case under conditions of more perfect combustion. In fact, it soon became evident that the determination of increase of luminosity by compression must be made in a manner precisely the reverse of that employed for the corresponding determinations in rarefied air, for, whilst in the latter case the experiments were made with flames which, at ordinary atmospheric pressure, were saturated with luminous

matter, in the former it was found necessary to commence with flames which were very feebly, or not at all, luminous at common pressures. Such is the effect of compressed air in determining the precipitation of carbon particles within the flame, that a small alcohol lamp which at the ordinary pressure burnt with a pure blue flame became highly luminous when placed under a pressure of four atmospheres, and it can scarcely be doubted that, at a pressure of five or six atmospheres, its luminosity would be equal to that of sperm oil burning at atmospheric pressure. Owing to these difficulties, I have only been able to obtain satisfactory determinations between one and two atmospheres. In these determinations the lamp was supplied with amyl alcohol, a liquid which, whilst affording an appreciable amount of light in the experimental flame under one atmospheric pressure, was found to burn under two atmospheres without smoke, although at a somewhat higher pressure it began to evolve fuliginous matter.

The results of the experiments approximate to those calculated from the law given for pressures less than that of the atmosphere, but when continued to still higher pressures results were obtained which differed very widely from those one would have expected. In discussing the probable causes of these and other slight variations from the law, Dr. Frankland says:—

The luminosity of the flames generally used for artificial light emanates from two sources, viz., first from the ignition of minute particles of carbon floating in the shell of the flame, and, secondly, from the incandescence of gaseous matters. The latter source of illumination probably does not furnish more than 1 per cent. of the total amount of light, consequently nearly the whole of the light given out by flames under ordinary circumstances is due, as Davy first pointed out, to the ignition of solid carbonaceous matter.

This shows that at this time (1861) his views on the cause of luminosity in flame were in accord with Davy's, and he finally sums up the influence of atmospheric pressure upon the combustion as follows:—

1. The rate of burning of candles and other similar combustibles, whose flame depends upon the volatilisation and ignition of combustible matter in contact with atmospheric air, is not perceptibly affected by the pressure of the supporting medium.

2. The luminosity of ordinary flames depends upon the pressure of the supporting medium, and, between certain limits, the diminution in illuminating power is directly proportional to the diminution in atmospheric pressure.

3. The variation in the illuminating power of flame by alterations in the pressure of the supporting medium depends chiefly, if

not entirely, upon the ready access of atmospheric oxygen to, or its comparative exclusion from, the interior of the flame.

4. Down to a certain limit, the more rarefied the atmosphere in which flame burns, the more perfect is the combustion.

It was in the June of 1861 that Frankland contributed these important observations to the Royal Society, and seven years later he published a still more important communication in their "Proceedings"—a paper in which he shows that flames like those of hydrogen or carbon monoxide in oxygen, which cannot possibly contain solid matter, yet can be made to emit light when burning under sufficiently high pressure. In this paper, which was read on June 11, 1868, he says:—

Further experiments, made more than a year ago, on the nature of the luminous agent in a coal-gas flame, led me to doubt the correctness of the commonly received theory first propounded by Sir Humphry Davy, that the light of a gas flame, and of luminous flames in general, is due to the presence of solid particles. In reference to gas and candle flames, it is now well known that the fuliginous matter produced when a piece of wire gauze is depressed upon such flames, and the sooty deposit which coats a piece of white porcelain placed in a similar position, are not pure carbon, but contain hydrogen, which is only completely got rid of by prolonged exposure to a white heat in an atmosphere of chlorine. On pursuing the subject further, I found that there are many flames possessing a high degree of luminosity which cannot possibly contain solid particles. Thus the flame of metal arsenic burning in oxygen emits a remarkably intense white light, and as metal arsenic volatilises at 180 deg. C., and its product of combustion—arsenious anhydride—at 218 deg. C., whilst the temperature of incandescence of solids is at least 500 deg. C., it is obviously impossible here to assume the presence of ignited solid particles in the flame. Again, if carbonic disulphide vapour be made to burn in oxygen, or oxygen in carbonic disulphide vapour, an almost insupportably brilliant light is the result. Now fuliginous matter is never present in any part of this flame, and the boiling point of sulphur, 440 deg. C., is below the temperature of incandescence, so that the assumption of solid particles in the flame is here also inadmissible. If the last experiment be varied by the substitution of nitric oxide gas for oxygen, the result is still the same, and the dazzling light produced by the combustion of these compounds is also so rich in the more refrangible rays, that it has been employed in taking instantaneous photographs, and for exhibiting the phenomena of fluorescence. Many other cases of the production of brilliant light from incandescent, gaseous, or vaporous matter might be cited, but I will mention only one other. Amongst the chemical reactions celebrated for the production of dazzling light, there are few which surpass the active combustion of phosphorus in oxygen. Now, phosphoric anhydride, the product of this combustion, is volatile at a red heat, and it is therefore manifestly impossible that this substance

should exist in the solid form at the temperature of the phosphorus flame, which far transcends the melting point of platinum. For these reasons, I consider that incandescent particles of carbon are not the source of light in gas and candle flame, but that the luminosity of these flames is due to radiations from dense but transparent hydrocarbon vapours. As a further generalisation from the experiment above-mentioned, I was led to the conclusion that dense gases and vapours become luminous at much lower temperatures than aeriform fluids of comparatively low specific gravity, and that this result is, to a great extent, if not altogether, independent of the nature of the gas or vapour, inasmuch as I found that gases of low density, which are not luminous at a given temperature when burnt under common atmospheric pressure, become so when they are simultaneously compressed. Thus, mixtures of hydrogen and carbonic oxide with oxygen emit but little light when they are burnt or exploded in free air, but exhibit intense luminosity when exploded in closed glass vessels, so as to prevent their expansion at the moment of combustion. I have recently extended these experiments to the combustion of jets of hydrogen and carbonic oxide in oxygen under a pressure gradually increasing to twenty atmospheres. These experiments were conducted in a strong iron vessel, furnished with a thick plate of glass of sufficient size to permit of the optical examination of the flame. The results are so remarkable that, although still far from being complete, I venture to communicate them to the Royal Society before the close of the session. The appearance of a jet of hydrogen burning in oxygen under the ordinary atmospheric pressure is too well known to need description. On increasing the pressure to two atmospheres, the previously feeble luminosity is very visibly augmented, whilst at ten atmospheres pressure the light emitted by a jet about one inch long is amply sufficient to enable the observer to read a newspaper at a distance of 2 feet from the flame, and this without any reflecting surface behind the flame. Examined by the spectroscope, the spectrum of this flame is bright and perfectly continuous from red to violet. With a higher initial luminosity the flame of carbonic oxide in oxygen becomes much more luminous at a pressure of ten atmospheres than a flame of hydrogen of the same size and burning under the same pressure. The spectrum of carbonic oxide burning in air is well known to be continuous; burnt in oxygen under a pressure of fourteen atmospheres, the spectrum of the flame is very brilliant and perfectly continuous.

This paper, striking, as it did, at the root of the fundamental ideas existing as to the causes of luminosity in flame, caused a profound sensation, and it was not long before the interest taken in it was made manifest by criticisms and attacks upon the new theory put forward. One of the first of these was by W. Stein ("Journal für pract. Chemie," 2, viii. 401), who, in criticising the various points in Frankland's paper with regard to the observation that the soot deposited from a luminous

flame is not pure carbon, but contains hydrogen, points out that:—

The first objection to this is that, as is well known, not only do all heavy hydrocarbons decompose with deposition of carbon at a high temperature in absence of air, but even marsh gas itself does so. Since now the hydrocarbons, whose vapours are supposed to produce the luminosity, are under such conditions before they are reached by the oxygen of the air, it cannot be doubted that they must undergo a decomposition in the luminous part of flames into carbon and hydrogen. Whether the separated carbon is chemically pure, or whether it is mixed with a body containing hydrogen, is of slight importance, since the chief question with which we are concerned is whether the soot is present in the flame as vapour or in the solid state. If it were a conglomerate of the densest light-producing hydrocarbons, whose vapours condense on the cold body, then it must, when strongly enough heated in absence of air, again be vaporised. This, however, is not the case, as everyone will find who tries the experiment. Moreover, its chemical composition is just as little favourable to Frankland's view. This will presumably vary according to the different luminous material from which the soot is obtained, and also according to the position in the flame from which it is taken. For the temperature of flame is, as is well known, different at different points, and, as known from the researches of Magnus, at lower temperatures, in addition to carbon, a tarry product containing hydrogen separates from the hydrocarbon. The soot of which I give an analysis below was collected from a gas-flame by sinking the bottom of a small silver kettle filled with water 2 to 3 millimetres deep into the flame. Benzine extracted from it traces of a solid yellow body, which, on account of its small quantity, could not be further examined. Nothing was extracted by alcohol, alcoholic potash, and dilute sulphuric acid. After careful and continued washing with boiling water and drying at 130 deg., 0.206 gave 0.6985 carbonic acid, 0.0195 water, 0.0020 ash. This amounts to:—

		On ash-free substance.
Carbon . . .	96.446 per cent.	97.390 per cent.
Hydrogen . . .	1.051 „	1.061 „
Ash . . .	0.970 „	—
Oxygen . . .	1.533 „	1.549 „

The oxygen which it contains must, I think, be ascribed to a small quantity of water being left in it even after drying at 130 deg. If this be deducted, then the water and ash-free substance consists of 99.905 carbon and 0.905 hydrogen. This analysis consequently confirms that view of the chemical composition of the soot of flames which is based on the known behaviour of hydrocarbons at high temperatures.

And again:—

In order to show that his view of the luminosity of vapour is not without examples, Frankland points to the luminosity which takes

MERRYWEATHERS' "COMPACT" FIRE HYDRANTS.

AS USED AT THE HOTEL METROPOLE (LONDON AND BRIGHTON), ALBERT PALACE, &c.

The "COMPACT" has following advantages:—

- 1.—It is a perfect Hydrant without packing.
- 2.—It takes up least possible space.
- 3.—It has large clear waterway.
- 4.—It is all gunmetal, and can be had with screwed or instantaneous outlet, and screwed or flanged inlet.

place on burning arsenic, phosphorus and carbon bisulphide in oxygen gas at the ordinary pressure, and hydrogen and carbonic oxide at an increased pressure, since in these cases the co-operation of solid particles cannot come in question. However valuable and interesting this all may be from a scientific point of view, it does not in any way prove that the process in our luminous flames must be an analogous one, since the well-established fact that solid bodies are specially adapted for becoming radiant is not altered by it, and up to the present only one solid body has been discovered to which one could ascribe the luminosity of these flames. When, therefore, all that has been stated is considered, no other conclusion can be arrived at but that the light of our luminous flames comes from incandescent particles of carbon, and that therefore the old view is the true one.

About this time Knapp showed that the luminosity of a coal-gas flame could be destroyed not only by admitting air, as in the Bunsen burner—which up to this time had been supposed to destroy luminosity by the more rapid combustion of the carbon particles—but also by burning the coal gas with inert gases, such as nitrogen and carbon dioxide, which could take no part in the combustion, a phenomenon explained by Wibel as being due to the cooling effect of these gases upon the flame, as luminosity may be restored by heating the mixture of gases just before combustion. These views were criticised by Dr. Karl Heumann in "Liebig's Annalen," vols. clxxi. and clxxx., as well as Frankland's work, concerning which he says:—

Frankland has broached the hypothesis that the luminosity of flame is not due to particles of suspended carbon, but is caused by the vapours of heavy hydrocarbons, which radiate white light. Strong positive evidence in support of a view so much at variance with the generally accepted theory could hardly be expected, and Frankland has relied principally upon the fact that we are acquainted with many luminous flames in which we cannot suppose that solid matter is present. To the instances already known Frankland has added the interesting observation that hydrogen and carbon monoxide when burnt in oxygen under a pressure of ten to twenty atmospheres yield a luminous flame affording a continuous spectrum, and also that the faintly luminous flame of alcohol becomes as bright as that of a candle when the pressure is increased to eighteen or twenty atmospheres. These experiments are not so convincing as might at first sight appear, inasmuch as we know that the temperature of the flame is increased at high pressures, and also at the temperature of the electric spark many gases yield a continuous in place of a line spectrum. The power of gases as regards emission of light also varies considerably under these circumstances, and it does not appear that we are absolutely necessitated, as Frankland has supposed, to ascribe the increase in luminosity to the increased density of the gas, although, doubtless, this circum-

stance is not without considerable influence. The inquiry as to the nature of hydrocarbon flames is quite independent of the meaning which we may attach to these appearances, and if Frankland puts forward the above-cited phenomena of combustion as analogies to guide him in views concerning carbon flames, no very forcible argument can be really deduced from the examples, because, as W. Stein has pointed out, it cannot be shown that the reaction in luminous carbonaceous flames must be an analogous one to that described above. Frankland's declaration that the soot must be regarded as an accumulation of heavy hydrocarbons, whose vapours are condensed on the cold body brought into the flame, may be regarded as almost confuted by Stein's objection—that in this case the soot must become gaseous at higher temperatures, which is not the case.

And then, going on to Wibel's conclusions, points out that—

Everyday experience tells us that the blue flame of Bunsen's burner, as well as that of the blow-pipe, possesses a much higher temperature than the ordinary luminous flame; but if Wibel be correct in saying that decrease in luminosity is a consequence of cooling only, then, logically, the temperature of the luminous flame ought to be higher than that of the non-luminous flame.

He then attacks the various problems which the Bunsen flame gives rise to, and finally concludes that—

When air destroys the luminosity of a coal-gas flame, there are at least three causes, each of which is capable of decreasing the luminosity of these flames, viz., withdrawal of heat, dilution, and oxidation of the luminous material. In most cases two or more of these causes are at work; in non-luminosity brought about by nitrogen and carbon dioxide, especially dilution and heat absorption; in the widening out of a flame caused by a cold surface absorption of the heat, and a more rapid oxidation of the carbon; and in non-luminosity caused by air, each of the three causes is at work. The flame of a Bunsen's burner appears to be the final product of a whole series of causes acting some in one direction, some in another, and it is not to be wondered at that observers of luminous flames have arrived at such diverse and contradictory conclusions, inasmuch as they have made the study of this flame their principal object, overlooking the great complexity of the conditions affecting it, instead of preceding such a study by an investigation of more simple instances of combustion.

He then fully discusses the effect of cooling upon the combustion in flames, and comes to the following important conclusions:—

1. The fact that a gas flame does not rest upon the burner nor a candle flame upon the wick, as also the fact that a flame never directly touches a cold body held within it, is to be explained by the cooling

ESTIMATES FREE. ESTABLISHED 1885.

PROOF IMPRESSIONS of the BEAUTIFUL ART PLATES which appeared in the New Year's Double Number of "THE ARCHITECT," and in the Number for January 10, 1890, THE TOILERS OF THE DEEP. Two Tinted Ink Photographs (size 18½ in. by 13½ in.), may now be obtained, price 1s. each. Free by post, carefully packed in patent roller, 2s. 3d.

GILBERT WOOD & CO., 175 STRAND, LONDON. W.C.

action exercised upon the gas by its surroundings. When the combustible gases are cooled throughout a definite space below their ignition temperature, the flame is extinguished.

2. The very considerable distance noticed between the burner and the flame of a gas issuing under high pressure, or mixed with a large volume of an indifferent gas, is to be traced to the cooling action of the stream of gas and of the outer air, and perhaps more especially to the velocity of propagation of ignition within the gas.

In a second paper, published in the "Annalen," clxxxiii., "On the influence of withdrawal from, and addition of heat to, luminous flames," several interesting points are discussed, and the author finally points out that—

A cold object brought into a luminous flare causes a suspension of the process of combustion in its immediate neighbourhood, and, at the same time, very materially diminishes the luminosity throughout a considerable space around itself. Carbon-containing luminous materials may burn with or without separation of carbon—that is, with or without luminous flames—according to a certain temperature, differing for each material, is or is not maintained. Combustible material which has been diluted with indifferent gases requires to be maintained at a higher temperature, in order that it shall burn with a luminous flame, than when it is not so diluted. The fact that soot is deposited on a cold object held in a luminous flame is no proof of decreased temperature within the flame, inasmuch as it has been shown that decreased temperature causes a diminution in the quantity, or even total suppression, of the separated carbon. Soot is also deposited on heated surfaces, but is quickly burnt on admission of air. Inasmuch as admission of air cannot be altogether prevented, less soot is accumulated on hot than on cold objects. Burners constructed of iron or other material possessed of high conductivity for heat cause a greater diminution in the luminosity of the lower part of the flame than burners of stearite. The difference between the luminosities of the two flames is rendered more apparent by artificially cooling the burner. The top of the burner and the entering cold gas both exert a cooling action upon the lower part of the flame, and are the cause of the space noticeable between the burner and the flame-mantle. By heating the burner and simultaneously the stream of gas, a more luminous flame is obtained without an increased consumption of gas, the increase in luminosity being greater the smaller is the consumption of gas. The change which is hereby caused in the chemical composition of the gas is without appreciable effect upon the luminosity, inasmuch as no diminution in luminosity is occasioned by again cooling the stream of gas. The heat communicated by increasing the temperature of the burner-tube acts in two ways: it increases the intensity of the light of the flame-mantle, and simultaneously enlarges the flame itself. Carbon is also sooner separated in the flame, and separated at a higher temperature.

His most valuable contribution to the question of whether luminous hydrocarbon flames contain solid particles or not, is to be found in volume clxxxiv. of the "Annalen," in which he shows that—

1. Chlorine causes an increase in the luminosity of feebly-luminous or non-luminous hydrocarbon flames. Inasmuch as chlorine decomposes hydrocarbons at a red heat, with separation of carbon, it follows that the increased luminosity is due to the production of solid carbon particles.

2. A small rod held in the luminous flame becomes rapidly covered on its lower surface—the surface exposed to the issuing gas—with a deposit of soot. The solid soot is evidently driven against the rod. If the soot were present as vapour in the luminous flame, its deposition would be due to a lowering of the flame temperature, and would therefore take place on all sides of the rod.

3. A strongly heated surface also becomes covered with a deposit of soot. This would not be possible if the deposit were the result of the cooling action of the surface upon the flame.

4. The carbon particles present in the luminous flame become visible when the flame is caused to rush against another flame, or against a heated surface. The separated particles are rolled together into larger masses, so that the luminous mantle becomes filled with numerous glowing points. The soot of such a flame is very coarse-grained.

5. The luminous mantle of a flame is not altogether transparent; the thicker the flame-layer and the greater the number of solid particles contained therein, the less transparent does it become. The transparency of a luminous flame is no greater than that of the—approximately—equally thick stratum of soot which rises from the flame of burning turpentine, and which is universally allowed to contain many solid particles. A luminous flame of hydrogen, containing solid chromic oxide, is as transparent as the hydrocarbon flame.

6. Those flames which undoubtedly owe their luminosity to the presence of finely divided solid matter produce characteristic shadows when viewed in sunlight. The only luminous flames which do not produce true shadows are those which consist of glowing vapours and gases. Luminous hydrocarbons produce strongly marked shadows in sunlight; these flames, therefore, contain finely divided solid matter. That this solid matter can be nothing but carbon is evident from the fact that other substances, capable of remaining solid at the temperature of these flames, are absent.

These proofs are, I think, sufficient to convince everyone that the luminous flames of the hydrocarbons actually contain solid carbon particles.

This splendid contribution to the carbon particle theory of luminosity in hydrocarbon flames was further strengthened by

researches made by Soret ("Philosophical Magazine," 1875), who showed the existence of solid particles in a luminous hydrocarbon flame by focussing the sun's rays upon the luminous portion of the flame and examining the light reflected by it by the aid of a Nicol's prism. Burch also, in 1885, did the same thing in a very similar way. Whilst demonstrating to his landlady that the sun's rays did not extinguish the fire, but only prevented the light emitted by the glowing embers being seen, he was struck by the power of the sunlight in overcoming the light emitted by even highly incandescent bodies; and found that on focussing the sun's rays on a flame a spot of light was visible on the highly luminous mantle of the flame, and the reflected light from this gave ample evidence, when examined by the spectroscope, of the presence of solid particles. Quite lately, also, Sir George Stokes has come to the same conclusion, by experiments of the same character.

I have this evening brought before you the one celebrated attack upon Davy's theory, and the further evidence which it brought forth; and I confess that to my mind the facts are so overwhelmingly in favour of Sir Humphry's original assumption as to the cause of luminosity in hydrocarbon flames, that although Dr. Frankland undoubtedly showed that solid matter was not a necessity for a luminous flame, yet we must admit that in the special class of flames we are considering, the light-giving power is practically entirely dependent on their presence. It must, however, be borne in mind that Dr. Frankland himself is in no way shaken in his opinion, and we may all hope to hear further proof of his theory.

Whilst the physical aspects of luminosity were being studied in this way, there had not been wanting attempts to attack the question from a chemical point of view, and the researches of Dr. Hilgard, Landolt, and Blochmann have done much towards enlightening us as to the chemical changes taking place in hydrocarbon flames.

REGISTRATION OF PLUMBERS.

THE committee of the Exeter Museum and Institute kindly granted the use of rooms in the museum for the purpose of a local examination of candidates for registration by the Worshipful Company of Plumbers, London. The examination was attended by a good number of plumbers residing in Exeter and the district. One of the rooms was fitted up as a plumbers' workshop, with fires for melting solder, &c. The examiners

present were Messrs. J. Knight and C. Dean (representing the London Board of Examiners), and W. Rowe and J. W. Chapman (representing the Plymouth Board of Examiners). Mr. T. N. Andrews, M.I.E.E. (hon. sec. to the Plymouth District Council) was also present. The examination consisted of three hours practical work and two hours theoretical work. During the progress of the examination the rooms were visited by the Sheriff of Exeter, Mr. D. Cameron, city surveyor, Aldermen Domville, Cole, Warren and Varwell, Dr. Harris and Dr. Bell, assistant medical officers of health, and others.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

16. Thomas Marcus Houghton, for "A new or improved balance or weighing-scales."
67. Frederick Ryland, for "Improvements in sash-pulleys or axle-pulleys."
87. John Hircock and William Davies, for "Improvements in a vent-peg."
107. Thomas Kennedy, for "An improved self-closing sash for the use of railway carriages, cabs or tramcars."
160. Walter Brierley, for "Improvements in chimney-tops."
189. Frederic Hitchmough, for "Improvements in sashes and window-frames."
249. Mark Fawcett, Brett Agate Elphicke and John Hope, for "Improvements in the construction of fireproof floors."
265. Frederic Arthur Martin, for "An improved chimney-pot."
314. Charles Edward Jackson, for "Simplex lever fanlight-opener."
346. Andrew Stevens Morrison, for "Improvements in securing door-knobs or handles to spindles."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

THE YOST

Made by the Perfection of the No. 2 Remington and Inventor of the Caligraph.

HAS NO RIBBON,

And possesses many other advantages over the older machines.

Scores of distinguished users of the YOST have pronounced it far and away the BEST TYPEWRITER.

The Original Testimonials may be seen at the Company's Chief Depot.

Used in conjunction with the Duplicating Apparatus the Typewriter is of great utility for producing, in large numbers, Bills of Quantities, Estimates, Specifications, Reports, &c.

TYPEWRITING TAUGHT FREE.

Send for Catalogue, containing full particulars of the advantages of the YOST Typewriter over every other Machine, to

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

COMPETITIONS OPEN.

CHADDLETON.—May 1.—Designs are Invited for Proposed Lunatic Asylum. Premiums of 200*l.*, 150*l.* and 100*l.* Mr. Matt. F. Blakiston, Clerk of the County Council, Stafford.

WAKEFIELD.—Feb. 1.—Designs are invited for the Erection of Council Chamber, Committee Rooms and Offices. Mr. F. Alvey Darwin, Clerk of the Peace, West Riding Offices, Wakefield. Premiums of 200*l.*, 100*l.* and 50*l.*

WINSFORD.—Feb. 13.—Designs, Estimates, &c., are Invited for Proposed Technical Schools and Gymnasiums. Premiums of 50*l.*, 15*l.* and 10*l.* Mr. J. Cowley, Secretary, 38 Witton Street, Northwich.

CONTRACTS OPEN.

ABERCARN.—Jan. 30.—For Building Master's House at Cross Roads School. Mr. George Rosser, Architect, 29 High Street, Newport.

ABERDARE.—Jan. 31.—For Building Business Premises. Mr. Charles H. Elford, Architect, 15 Cardiff Street, Aberdare.

ALSTON.—Jan. 28.—For Building Farmhouse, Tyne Head. Messrs. Webster, Son & Banks, Land Agents, Kendal.

AMLWCH.—Jan. 28.—For Building Semi-detached Villa Residences, Construction of Roads, Drains, &c., Bull Bay. Mr. Robert Grierson, Architect, Bangor.

BATLEY.—Jan. 28.—For Building Pair of Semi-detached Residences. Messrs. P. Spencer & Son, Architects, Batley Carr.

BELFAST.—Jan. 31.—For Building Warehouse. Mr. Henry Seaver, Architect, Belfast.

BELFAST.—Jan. 31.—For Building Workers' Dwelling. Messrs. Young & Mackenzie, Architects, 7 Donegall Square East, Belfast.

BRISTOL.—Jan. 30.—For Building Two-Floor Shed, Dean's Marsh, Docks. Mr. J. M. McCurich, Engineer, Cumberland Basin, Bristol.

BURNLEY.—Feb. 8.—For Plumbing, Glazing, Painting and Hot-water Apparatus, for New Workhouse Infirmary. Mr. S. Keighley, Architect, Nicholas Street, Burnley.

BURY.—Jan. 30.—For the Walls for New Buildings for the Textile Operatives' Association. Mr. D. Hardman, Architect, Silver Street, Bury.

CALEDONIAN RAILWAY.—Feb. 6.—For Station Buildings and Goods Sheds. Messrs. Strain, Robertson & Thomson, C.E., 154 West George Street, Glasgow.

CARLISLE.—Feb. 7.—For Plastering (Robinson's Cement) and Fireproof Flooring at Asylum. Mr. G. D. Oliver, County Architect, The Courts, Carlisle.

CARLOW.—Feb. 2.—For Additions to Workhouse. Mr. J. G. Glover, Clerk to the Guardians, Carlow.

COLCHESTER.—For Rebuilding Furniture Depository. Mr. J. W. Start, Architect, Cups Chambers, Colchester.

CORWEN.—Feb. 4.—For Building Four Houses. Mr. John Williams, Architect, Dee View, Corwen.

DARTMOUTH.—Jan. 31.—For Construction of Sewers. Mr. T. O. Veale, Borough Surveyor.

DUMFRIES.—Jan. 31.—For Mason and Ironwork for Bridge at Drumpark. Mr. J. Symons, Writer, Dumfries.

DUNDALK.—Jan. 30.—For Building Offices, Waiting-rooms, Refreshment-rooms, &c., at New Station. Mr. W. H. Mills, Engineer-in-Chief, Amiens Street Terminus, Dublin.

DUNDALK.—Feb. 13.—For Construction of Sewers. Mr. J. Gaskin, Surveyor, Town Hall, Dundalk.

DURHAM.—Jan. 30.—For Building Six Houses, Red Hills. Mr. H. T. Gradon, Architect, Framwellgate Bridge, Durham.

ELLAND.—Jan. 27.—For Building Two Houses. Messrs. R. Scarborough & Son, Victoria Road, Elland.

FOLESHILL.—Jan. 31.—For Building Senior Boys' School. Messrs. G. & J. Steane, Architects, 22 Little Park Street, Coventry.

GLASGOW.—Jan. 30.—For Stables, Cart-shed, &c., at Partick. Mr. J. Young, 64 Cochrane Street, Glasgow.

GWAELODYGARTH.—Jan. 31.—For Building Master's House. Mr. R. Y. Evans, Guildhall Chambers, Cardiff.

HALIFAX.—Jan. 28.—For Building House, Stables, &c., Mr. Raymond Berry, Architect, Arcade Chambers, Halifax.

HALIFAX.—Feb. 3.—For Building Shed, Skircoat Green. Mr. J. Farrar, Architect, 29 Northgate, Halifax.

HANDSWORTH.—Jan. 31.—For Additions to Board Schools, Boulton Road. Mr. J. R. Nichols, Architect, 59 Colmore Row, Birmingham.

HASLINGDEN.—Jan. 28.—For Building Vicarage. Mr. H. Fielding, Architect, Haslingden.

ILLOGAN.—Jan. 30.—For Additions to Board Schools. Mr. Sampson, Architect, Symon's Terrace, Redruth.

KENDAL.—Feb. 14.—For Building First Two Blocks of Twelve Dwelling-houses. Mr. John Hutton, Architect, Kendal.

KILBOLIN.—Feb. 1.—For Building Caretaker's House and Enclosure Wall at Cemetery. Mr. O'Hanlon, C.E., 8 Westland Row, Dublin.

KING'S CROSS.—Jan. 28.—For Pulling-down Octagon Tower. Mr. W. H. D. Horsfall, Architect, 9 Harrison Road, Halifax.

KING'S LYNN.—Jan. 28.—For Building Technical School. The Borough Surveyor.

LEEDS.—Jan. 31.—For Building Stables for Messrs. Combe & Co., Limited. Mr. W. Wynn, Surveyor, 10 Livingstone Street, Roundhay Road, Leeds.

LLANELLY.—Jan. 31.—For Building Six Shops and Club Premises. Messrs. Buckley Wilson & Glendinning Moxham, Architects, Swansea.

LONDON.—Jan. 27.—For Addition to Patent Office. H.M. Office of Works, 12 Whitehall Place, S.W.

MANCHESTER.—Feb. 9.—For Additions to Horse Hospital. The Engineer's Office, London Road Station, Manchester.

MARYBOROUGH.—Jan. 30.—For Building Chapels and other Additions to Lunatic Asylum. Mr. Thomas Drew, Architect, Dublin.

MERTHYR TYDFIL.—Jan. 28.—For Building Thirty-three Houses. Mr. John Williams, Architect, Edward Street, Morgan Town, Merthyr Tydfil.

MERTHYR TYDFIL.—Feb. 7.—For Building School. Mr. Morgan, Master, Workhouse, Merthyr Tydfil.

MILE END.—Jan. 30.—For Building Pavilions, Laundry Block, Kitchen, Boiler-house, &c., at Workhouse. Mr. Bruce J. Capell, Architect, 70 Whitechapel Road, E.

VERITY BROS. CALL LANE, LEEDS.

Manufacturers of their High-Class

ROLLING BOLT, MORTICE & RIM LOCKS, NIGHT LATCHES, &c.

In our Deadweight Lock as per drawing herewith, we have so applied the different Movements that the pressure is equal in both ways of turning the knob, and we guarantee their giving entire satisfaction.

We are also Manufacturers of—

The largest Varieties of Openers suitable for Skylights, Fanlights, &c., which can be fixed in any position.

Casements in Wrought Iron, Steel, and Gun Metal.

Espagnolette Bolts, Weather Bars, Sash Fasteners, Door Checks.

CATALOGUES FREE BY POST.

MILLOM.—Jan. 30.—For Building Board School for Girls and Alterations to School. Mr. W. T. Lawrence, Milloom.

MISKIN.—Jan. 27.—For Building Hotel. Mr. T. Roderick, Architect, Clifton Street, Aberdare.

MORLEY.—Jan. 28.—For Building Wesleyan Chapel and School. Mr. T. A. Buttery, Architect, Morley.

MOUNT PLEASANT.—Feb. 20.—For Second Portion of Parcel Post Office. H.M. Office of Works, 12 Whitehall Place, S.W.

NOTTINGHAM.—Feb. 3.—For Additions to School of Art. Mr. Arthur Brown, Borough Engineer, Guildhall, Nottingham.

OTTERBOURNE.—Feb. 4.—For Building Police-station. Mr. J. Cresswell, County Architect, Moot Hall, Newcastle-on-Tyne.

OXFORD.—Feb. 7.—For Erection of Municipal Buildings. Mr. Henry T. Hare, Architect, 1 York Buildings, Adelphi, W.C.

PORTSMOUTH.—Feb. 21.—For Construction, Alterations and Reparation of Sewers, for the Urban Sanitary Authority. Mr. Alexander Hellard, Town Clerk.

PWLLGWAUN.—Jan. 31.—For Building Infants' School. Mr. J. J. Evans, C.E., Penarth.

SEDGLEY.—Feb. 18.—For Additions to Board Schools. Mr. A. P. Brevitt, Architect, Red Lion Street, Wolverhampton.

SOUTHAMPTON.—Jan. 30.—For Fittings and Furniture for Public Library. Mr. A. E. J. Guy, Architect, 79 Albert Road, Southsea.

SOUTHAMPTON.—Feb. 16.—For Enlargement of Board Schools, Sholing. Messrs. W. H. Mitchell, Son & Gutteridge, Architects, 9 Portland Street, Southampton.

STRATFORD.—Feb. 14.—For Construction of Underground Urinal. Mr. Lewis Angell, Borough Engineer, Town Hall, Stratford, E.

SWANSEA.—Jan. 28.—For Building Premises. Mr. H. C. Portsmouth, Architect, Castle Buildings, Swansea.

SWANSEA.—Feb. 1.—For Additions to Grand Hotel and Building New Premises. Mr. T. P. Martin, Architect, Heathfield Street, Swansea.

SWINTON.—Jan. 30.—For Enlargement of Board School. Mr. H. L. Tacon, Architect, 11 Westgate, Rotherham.

TREHARRIS.—Feb. 8.—For Enlarging Chapel. Mr. E. E. Watkins, Grocer, Penn Street, Treharris.

TYNEWYDD.—Jan. 31.—For Building Sixteen Cottages. Mr. P. J. Thomas, Nolton Street, Bridgend.

WALSALL.—Feb. 14.—For Building Board Schools. Messrs. Bailey & McConnal, Architects, Bridge Street, Walsall.

WIMBLEDON COMMON.—Feb. 7.—For Pulling Down and Rebuilding Windmill. Mr. Jesse Reeves, Manor Cottage Wimbledon Common.

TENDERS.

ALDERSHOT.

For Alterations to the Bank Tavern, Grosvenor Road, Aldershot. Mr. STANLEY PARKER, Architect, 427 Edgware Road.

MARTIN, WELLS & CO., Aldershot (accepted) .£450 0 0

BRIGHTON.

For Building Public Abattoir, Supply and Erection of Machinery, &c., at Corporation Yard, Hollingdean Road, Brighton. Mr. FRANCIS J. C. MAY, C.E., Architect.

PERFECTION IN FANLIGHT OPENERS AND OTHER SASH & WINDOW FITTINGS.

ROBT. ADAMS's new and approved Patented Appliances and Gear for opening, closing, and fastening Skylights, whatever their size, weight, or position. Continuous ranges of Skylights can be easily and safely manipulated by ROBT. ADAMS's Patent Systems, which without doubt stand unrivalled.

ROBT. ADAMS'S Patent Ventilating Apparatus for Continuous Sashes of Lantern Lights, Conservatories, &c. Number of Patent, 16,610, dated December 2, 1887.

The largest and best variety of Fanlights and Sash Openers, &c., to suit all requirements, viz., details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery. Iron Casements and Frames. Architectural and other Metal Work, &c., &c.

ROBT. ADAMS,

Building Trades Emporium, 67 Newington Causeway, London, S.E.

Telegrams:—"Robert Adams, London."

No. 190.—New and special form section Weatherproof Metal-tongued Casement Bolt. Neat, strong and efficient.

No. 208.—Special thrust-motion round section Bolt suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong, and reliable.

DEPTFORD.

For Construction of Underground Urinal, High Street, Deptford. Mr. J. NIDD SMITH, Engineer and Surveyor to the Board of Works for the Greenwich District.

ELEVENTH ANNUAL

BUILDING EXHIBITION

Of all Industries connected with the Building Trades,

MARCH 11 to 25, 1893.

"THE ARCHITECT" says of the 1892 Exhibition—

"The representatives of all industries connected with the building trades will be wise to commence at once their preparations for the Exhibition. There cannot be as loud a preliminary flourish about an Exhibition in Islington as there is always about one of those designated as 'international'; but if exhibitors will consider the results of the two classes, they will discover that in the former they have met men of business and received orders, while for the privilege of participating in the universal shows they have not only lost large sums, but discovered that the dilettanti and holiday makers, who constitute the mass of visitors, are not fascinated by the best aids to construction."

JOHN BLACK, Secretary.

Exhibitor Offices: 2 Newcastle Street, Strand.

DECORATIVE WORK IN THE CITY.

THE great dome at the City Bank, Threadneedle Street, is worth the attention of architects. The ironwork divides it into twenty-four bays of five panels each tapering at top. It is treated ornamentally, two designs being used, alternated in each bay. The glass used is three-eighths of an inch rough rolled and the ornament is painted and stained, the effect being obtained by the variety in the stain from a pale gold to a rich amber. The base of each bay is over four feet, and the height of each of the five panels forming the set is close upon another four feet, the panes being bent to the proper curves. Of course, the thickness of the glass and size of the panels necessitated the greatest care in the selection of the glass, firing, bending and fixing, but the whole was most successfully carried out by Messrs. Duff & Spagnoletti, of the Hogarth Studios, London, W.

'SPHINX' PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 14 inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving. "ECLIPSE" PORTLAND CEMENT

Quick setting; test, 8 parts. Standard Testing Sand, 280 lbs. per square inch; 28 days. The finest, most plastic, best sand carrying, and cheapest cement in the market. Specially

adapted for laying encaustic tiles, making joints in sanitary pipes, interna stucco, concrete foundations, &c.

7 Samples sufficient for Practical Tests Free. Manufactured by JOHN BOARD & CO., Durball, Bridgwater.

Although various causes were against the panes resisting great changes in the atmosphere, besides the fact of the iron contracting or expanding, it has stood the test without the cracking of a single piece.

THE ALEXANDRIA COMPOUND.

AMONG the useful paints that modern ingenuity has devised it will not be easy to find anything more excellent than the Alexandria compound, which is a substitute for paint and distemper. This material can in no sense be considered one that is on trial, as it has been in use for a sufficient number of years to make or miss its mark, and for the past twenty-five years it has been supplied to the French Government; and, moreover, the manufacturers have sufficient confidence to sell under a written guarantee. Judging from the samples also, it can easily be believed that the merits claimed are not over estimated. Any tint or shade can be made to order, in addition to the standard shades. It is applicable to both woodwork and ironwork as well as walls, but in giving an order the material to be covered with it must be specified. Thus it is described as equal in appearance to the best flatted paints, and when varnished superior to paint; that it is fire-resisting, non-poisonous and odourless, while one hundredweight will cover 800 super yards; that it is durable and much cheaper than paint, and will not crack or blister through heat. It is recommended for mansions, churches, colleges, hospitals, railways, factories, Board schools and other public and private buildings; for inside and outside of walls, wood and all kinds of ironwork, steamship funnels, paper, &c. Siccatis brilliant is an enamel paint drying on everything in any weather in twenty minutes, and claimed as the best cure for damp walls. With two coats of this enamel applied to the dampest or the most dirty places the hardness and brilliancy of porcelain are obtained in two hours. Instant enamel dries on everything and in any weather in twenty minutes, and can be mixed with any paint, ground in oil or in powder. Iron enamel for out-door work, as a most durable enamel paint, is recommended to be applied on bricks, cement, iron, wood, tin and all kinds of out-door work. Paris white enamel is white and bright as the most beautiful porcelain, and is for finishing on white ground for all kinds of decorations, baths, statues, &c. The manufactories are—in London at 16 New Church Road, Camberwell; and in Paris at 37 Rue des Rosiers, St. Ouen. The sole proprietors are W. E. Spencer & Co., 68 North Street, Gore Wharf, Hackney, N.E.

SASH-CASEMENT COMPANY'S PATENT WINDOW.

THE advantages claimed for this specialty over ordinary windows are as follows:—1. The invention can be applied to any ordinary window. 2. By the system of attaching sash-cords all the time taken up in getting out the sashes, removing the front beads, parting beads, &c., is saved, and the woodwork and painting are not damaged. 3. The pulley arrangement consists only of two spindles and four loose wheels, and these can be applied so easily that any one without mechanical skill may undertake it. 4. The most important function claimed for this patent is, that by one single action the ordinary sash-window is at once converted into a casement-window, and thereby making window-cleaning safe, easy and pleasant. 5. The whole of the painting of sashes and frames, inside and out, can be easily done from the inside, thus saving the time in splicing and unsplicing of ladders, and the requirement of a man at the foot of the ladder as required by the Corporation by-laws. 6. That when any parts of the patent window get difficult to work, the affected parts are easily accessible, and adjusted without disturbing any portion of the window. 7. That through the opening of the top or bottom or both of the sashes of the patent window when in use as a casement, large articles of furniture, &c., can be removed with ease, thus saving the cost of a joiner in removing and replacing the sashes. 8. That in case of fire a large opening can be easily and quickly made to get rid of heat and smoke, and to pass out goods, &c., without necessitating the firemen to smash the glass and cut away the frames. 9. That as the patent window is made to fit very true, and has, when closed, an extra binding on each side, it is necessarily more weather-proof than an ordinary window.

IRON AND STEEL MANUFACTURE.

THE *Glasgow Herald*, among other reports of the local industries for the past year, gave the following details:—

Iron Roofing.

The reports in connection with this class of work, which may be taken to include building constructional work generally in so far as iron and steel are concerned, are, upon the whole, of a favourable nature, most of the firms engaged in this particular line having been well employed during the year.

THE DENSMORE.

THE WORLD'S GREATEST TYPEWRITER.

TO ARCHITECTS.—If you have come to the conclusion that the use of a Typewriter for writing your Specifications and Contracts will **SAVE YOU TIME AND MONEY**, give the DENSMORE a thirty days' trial before purchasing any other.

The Machine may then be returned if not found satisfactory in every respect, and a decided advance in typewriting mechanics.

If you decide to purchase it, we guarantee it free from all mechanical defects, and keep it in order for two years free of any charge.

TWO CARRIAGES, fitted with **SOFT** and **HARD** CYLINDERS, which are instantly **INTER-CHANGEABLE**, are furnished with each Machine without extra charge—thus one DENSMORE performs the work of two ordinary machines.

NO LIFTING OF CARRIAGES REQUIRED IN ORDER TO SEE YOUR WORK.

If you require anything in Typewriting Supplies, give us a call and look over our stock. We have seventy-five different grades of Typewriting Papers and a large stock of the best Carbon Papers. Typewriting of all kinds neatly and promptly executed by a corps of skilled operators.

DESIGNS AND ESTIMATES ON APPLICATION.

Offices and Showrooms:—42 Lamb's Conduit Street, London, W.C. Works:—Tooting, Surrey.

Amongst the more important contracts entered into may be mentioned the new retort-house and coal-store for the Glasgow Corporation Gas Commissioners at Dawsholm. This contract has just been completed by Messrs. P. & W. MacLellan (Limited), who are presently engaged upon a similar contract for the Corporation of Paisley. Messrs. MacLellan have also erected during the year the roofing of a new passenger station at Ardrossan for the Glasgow and South-Western Railway Company, and are just completing the large double goods shed at Cessnock Dock, Govan; while they have executed many important foreign contracts for roofing and work of a similar nature. Messrs. Findlay, of Motherwell, have been busily engaged during the year with the roofing for the Caledonian Railway Princes Street Station, Edinburgh, and have otherwise been fairly well employed. Other important contracts that may be mentioned were the electric lighting station in Waterloo Street, also the roofing of new tube-works at Coat-bridge. There is a considerable volume of work in hands at the moment, but of the prospects for the future much cannot be said of an encouraging nature.

Cast-iron Pipes.

This, which is one of the leading industries of the Glasgow district, has during the year 1892 been subject to the general depression. The whole output for the year has been considerably below the average. Hardly any large contracts for abroad have been secured by local makers, although various small indents for pipes have been executed for all parts of the world. The excessive protection given by the Australian colonies to colonial pipefounders is practically closing these markets against the mother country. There have been a few good inquiries from India, but only one or two of them have been secured by Glasgow foundries. Nothing whatever has been done in South America, where before the Baring crisis many thousands of tons were shipped annually from Glasgow to Buenos Ayres alone. However, this part of the world is gradually resuming a state of financial tranquillity, and more orders are hoped for during 1893. For North America a small contract for Vancouver Waterworks has been executed, and also one or two orders for South Africa. The extra large quantities of pipes required by local water and gas works have helped to keep the various foundries employed—Glasgow, Dundee, Edinburgh, Aberdeen and other corporations have all been large purchasers during the year. The most important contract has been the pipe main from Craigmaddie new reservoir to the

city, amounting to about 11,000 tons of 36-inch pipes, which was fixed in the autumn. There are several good orders likely to be placed soon, the principal of which is 20,000 tons of large pipes for the waterworks of Tokio, Japan, and it is anticipated it may come to Glasgow. The amicable relations between pipe foundries and moulders which characterised the preceding year have been maintained during 1892.

Ironfounding.

Light ironfounding has been well maintained during the year, but the prices obtainable show no improvement, and this applies more especially to the plain light castings. The home trade, which almost entirely depends on the state of the building trade, has had the benefit of the exceptional briskness in the latter. Foreign shipments, although better than 1891, are very far short of what they should be, and the prospects for 1893 are anything but bright. The Sun Foundry has been fully employed during the whole year. In some of their departments they have been unusually busy, being unable to cope with their orders, and being compelled through want of room to employ moulding shops outside their own city foundry in Kennedy Street. Verandahs, balconies, shelters, drinking fountains, station work, public conveniences, and stable fittings have been in much greater demand this year than last, but chiefly for home use, while bandstands, kiosks, pavilions, sanitary, and especially ornamental lavatory and bath, castings have been supplied almost entirely to foreign order, the South of Africa now taking rank as a most important buyer. There has been a constant run of orders for handsome electric pillars for the principal cities at home and abroad where street installations have been effected, and with very few exceptions this foundry has secured the whole of the orders for these important castings which have yet been offered to the trade. The foreign orders for rain-water goods have not been so plentiful at acceptable prices as in the past year, though within the last four months large orders have been accepted for Australia and South America which will take up a big amount of tonnage. Prospects for the coming year are fully as brilliant as they have been in any previous year, the firm being already pretty well booked up, both in structural work and heavy ornamental castings.

Light Castings.

During the past year the light-castings trade in the Falkirk district has been very good, and all the foundries kept fully employed. The present social difficulty—the unemployed—

has not been experienced in this district. It is true that in such a large manufacturing centre there will always be a certain number of men out of work; but depression of trade has not caused any suffering, nor strife nor unpleasantness, between the employers and employed. This redounds greatly to the credit of the employers for their forbearance and consideration for their workpeople, as in many cases competition has had to be met by reduced prices, and so far without their seeking any corresponding reduction of wages. It is cheering to record in these days that we find one district at least free from the turmoil of industrial war, and where wise and prudent counsels evidently prevail. At Carron Works, which are the oldest and principal works of the kind in the kingdom, trade has been exceptionally good, with an increasing demand for higher and better class goods. For special cooking apparatus and appliances—for coal, steam, and gas (which is now a specialty at Carron)—there has been a steady demand both for home and abroad, also for stable and cattle house fittings. A slight falling off in the home demands has been counterbalanced by an increased trade from the colonies. So much has this business at Carron developed that further additions to the shops and plant will shortly be a matter of necessity to overtake the orders coming in. In the engineering section considerable orders are on hand for engineers' blocks, torpedo gear, block bindings, rigging screws, radiators and ship sidelights, cabin seat-stands, and other furnishings for ships. The growth of this department, and the demand for special tools and plant for the general moulding and fitting shops, has necessitated the establishment of a special department, equipped with good machines, for making all the special plant required by any department of the works, and as a matter of course in such a large concern it is generally very busy. In the heavy foundry department trade has not been sought for general work in consequence of the prevailing low prices for this class of castings; but recently a contract has been made with the North British Railway Company for the castings required in the construction of a new tunnel under the Mound, Edinburgh, and it is hoped that this may be followed by others of a similar nature. It is now an undisputed fact that the Falkirk district is the most important centre of the light-castings trade in the United Kingdom. Years ago, and until very recently, the Sheffield and Rotherham district had an undoubted sway; but now there are several firms in the district besides the Carron Company who can hold their own against the Yorkshire houses, and in some respects are able to beat them. The district is awakening to the im-

portance of art and technical education, and when the efforts that are now being made in this direction—and especially to develop and educate the artistic taste in the district—meet with success, then there will be assuredly a greater future for the Falkirk neighbourhood in this special branch of industry.

Bridgebuilding.

In concluding our report for the year 1891 we mentioned that there was a fair amount of work then in hands, and that the prospects at the time were of an encouraging nature. We are pleased to have to report that during the year now drawing to a close our local bridgebuilders have been well supplied with orders, both for home and foreign account. Amongst the former may be mentioned the new Rutherglen bridge across the Clyde, the contract for which was secured by Messrs. Morrison & Mason. This is, however, built mainly of granite resting on steel caissons. The same firm have also secured the contract for the temporary bridge to be erected across the Clyde at Jamaica Street, and we understand Messrs. William Arrol & Co., Dalmarnock Ironworks, will supply the steel girders. This latter firm secured the contract for the Bonar Bridge across the Kyle of Sutherland, and during the year have been well occupied with the Tower Bridge, London, and other important contracts. Messrs. MacLellan (Limited), of Clutha Works, have turned out a large tonnage during the year, principally on foreign account, and amongst their contracts may be mentioned a floating railway bridge to cross the river Sardah in India. The girders will rest upon pontoons anchored in the river. This company has also constructed a bridge consisting of 34 spans of 90 feet each and another of 23 100 feet spans for the Indian railways, and have just completed the Bilston Viaduct, on the North British Railway near Roslin. Other bridge builders in the district have been more or less well employed, and upon the whole it may be said that at least an average amount of work has been turned out during the year. Competition has been pretty keen with most of the contracts, and as a consequence builders report that there has been but a bare margin of profit left. Prices have been gradually falling, in keeping with the reductions that have been taking place in the cost of steel. From all that we can gather, there is a fair amount of work in the hands of builders at the moment, and some good inquiries are in the market, principally for foreign account. There have been no trade disputes of any consequence during the year, but wages, as is the case in most trades, are looking downwards.

BUILDING AND BUILDERS.

THE Aberdeen University private Bill, which proposes an extension of the existing buildings and the re-erection of Greyfriars' Church, has passed the Standing Order stage.

THE Warwickshire County Council have sanctioned a recommendation of the County Buildings Committee to purchase 2,460 square yards of land in Victoria Road, Aston, at a cost of 4,525 $\frac{1}{2}$ l., adjacent to the present police-court, for the purpose of erecting a new Petty Session Court-house, at an estimated cost of 9,000l.

THE Tunstall Board of Guardians have decided on the erection of a new hospital and certain alterations at the workhouse, for the purpose of increasing and improving the accommodation, the estimated cost of the work being 6,000l.

AT the meeting of the Glasgow Association of Students of the Institution of Civil Engineers, Mr. Robert Robertson, vice-president, in the chair, a paper was read by Mr. W. B. Venters on "Building Stones: their Chemistry and Geology," in which the author went very fully into the chemical composition of stones and their power of resisting atmospheric influences.

BUILDING operations for the erection of the South-Eastern Hotel at Deal, to carry out which a company has been formed, are to be commenced in the next six weeks. Mr. Laidlaw, the proprietor of the Deal Pier, has joined the board of directors.

THE new general Post-office for Tunbridge Wells will be built in Vale Road, and a new central sub-office will be built near the entrance of the Calverley Road.

THE Board of Guardians at Chesterfield are at present considering a proposal to enlarge their workhouse, as increased and improved accommodation is thought necessary.

PLANS have been approved by the Rickmansworth Rural Sanitary Authority for the erection of six new almshouses in Bury Lane, Lord Ebury having given the site. The erection of the houses is to be put in hand as soon as the weather permits.

THE annual meeting and dinner of the Bristol Master Builders' Association has just been held, Mr. E. T. Hatherly, the retiring president, in the chair. Mr. A. Krauss was elected president for the ensuing year. Mr. A. Barratt responded to the toast, "Architects, Engineers and Surveyors."

THE new church of St. Michael and All Angels, Barnes, has been opened. Mr. Charles Innes, architect, of No. 27 Queen Street, City, designed the church and superintended its erection. Messrs. Balaam Brothers were the builders. The cost of the portion of the building at present erected has been about 5,000l.

TRADE NOTES.

WE have received from Messrs. William Sugg & Co. a copy of their "Gas Engineers' Pocket Almanac," which contains much useful information, not only for gas engineers, but also for architects and builders, including, for example, the requirements of the Metropolitan Gas Referees, for the testing of the illuminating power and purity of gas. Included with these are particulars of the apparatus required. Then we have an account of various forms of "photometer," and various indicators and meter-testing apparatus. This little volume also contains a useful series of tables for comparing weights and values of gases and liquids. The work should be in the hands of every architect in the kingdom.

IT is stated that the tender of Mr. Walter Binns, of Bradford, has been accepted for the chief portion of the work in the extension of the Menston Asylum.

THE Board of Guardians, Tunstall, have accepted the tender of Messrs. Rowell & Co., London, for the erection of an attendant's cottage of corrugated iron, to add to the accommodation of the infectious wards at the workhouse, for the sum of 122 $\frac{1}{2}$ l.

THE annual report of the Visitors of the Somerset and Bath Pauper Lunatic Asylum states that the tender of Mr. Phillips, of Exeter, at 113,300l., for carrying out the building of the New Western Asylum has been accepted, and the contract prepared accordingly. This does not include roads, fences or electric light.

A COMPANY has been formed for the purpose of acquiring and working the English patent rights of Mason's patent safety-tread covering for stairs, steps, platforms, floors, landings, &c., which is believed to have been demonstrated to be the most valuable invention of the kind ever introduced to the public, and one that cannot fail to supersede all other tread coverings. It provides a perfectly sure foothold, is in the highest degree durable and can be supplied and fixed at a less cost than other patent coverings. The offices are at 15 Barbican, E.C., Mr. A. Reid (*pro tem.*) secretary.

ELECTRICAL.

AT Irvine another inspection of the Burgh Mill has been made at the instance of the Corporation. Mr. Carrick (Carrick & Ritchie, Edinburgh, patentees of the Waverley turbine), accompanied by a representative of Messrs. Anderson & Munro,

FAWKNER, ROGERS & CO.

We beg to inform you that Mr. J. R. FAWKNER, who for the past fourteen years has held a responsible position in the London Works and Offices of Messrs. CROSSLEY BROS., Lim., original makers of the well-known "Otto" Gas Engine, has resigned his position to enter into partnership with Mr. HENRY J. ROGERS, M.I.M.E., under the above style, as Manufacturing Engineers, Electricians, and Founders.

The following are **SPECIALTIES**:—

GAS ENGINES.—Every Machine of Note will be found in our Showrooms. Special Oil for Gas Engines at Wholesale Prices

ROGERS'S PATENT GAS WORKS.—For either Coal or Oil Distillation, erected for Public Buildings, Mansions, &c.

DAWSON'S LOW-PRESSURE STEAM HEATING.—Sole Agents for same. Absolute immunity from danger.

ELECTRIC LIGHTING & FITTING.—STATTER'S Dynamos, Motors, Fittings, Switches, &c.

PATENT VENTILATING FAN, &c., SHAFTING, PULLEYS, AND CASTINGS OF ALL DESCRIPTIONS.

These magnificent Showrooms are intended as a Depot where the buyer can find an ample selection of Machinery and accessories.

electrical engineers, Glasgow, visited the mill, with the view of calculating the water-power and other power available. Mr. Carrick expressed the opinion that with the steam and water power at command a current might be generated sufficient to give the town between forty and fifty arc lamps.

THE *Scotsman* says:—The deputation from the Edinburgh Town Council who recently inquired into various systems of electric lighting in use across the Border have now adjusted their report. After stating that they feel sure that the delay of the Corporation in taking up the work has been of great advantage to the city, on account of the experience gained by other towns, they state that from conversation with certain authorities they learned that experience had shown that electric lighting is not likely to prove profitable until the second or third year, as many consumers only apply after they have seen the light used by more enterprising neighbours; but in the various places visited the deputation found that the demand for electricity was increasing. They were very strongly advised by the authorities with whom they came in contact to work the Electric Lighting Order themselves, and not to hand it over to a company, but at this stage they are not prepared to give a preference to any of the systems visited.

At a recent meeting of the Insurance Institute of Ireland, in Dublin, a paper was read by Mr. A. E. Porte on "Fire Risks from Electricity." The subject was exhaustively dealt with, and illustrated by experiments and diagrams. Mr. Porte explained how the risks from imperfect installations constitute a source of danger, and pointed out the means by which these could be avoided.

At the meeting of the Leeds Architectural Society Mr. T. S. Watney (Shepherd & Watney, civil engineers, Albion Street, Leeds) delivered a lecture on "Electric Lighting." He explained the various forms of motive power used in supplying the electric light in private houses and also for extensive private installations. He next described the dynamo, the arc-lamp, the incandescent-lamp, switches and other apparatus, showing how the form of those appliances had been improved of late years. Forms, he said, that were almost perfect eight years ago were now considered totally inadequate by fire-insurance companies and by good engineers. He exhibited samples of the older apparatus and of the new, pointing out the difference between the two. The materials now used must be of an incombustible character. Vulcanised rubber-covered wire has now almost superseded the old cotton and plain rubber-covered wire. He

then explained the best method of wiring a house, showing how the wires should be carried from one room to another. Every piece of wire throughout the installation should be easily got at, so that it might be repaired when required without disturbing either the walls of the rooms or the wall-paper. Finally he touched on the best forms of fittings and the general cost of the electric light.

THE *South-Eastern Gazette* says:—Mr. Hawtayne has presented a scheme to the Maidstone Local Board in accordance with the resolution arrived at in October last. We are unable to-day to give more than its chief points. Under this scheme he proposes to erect a supply station at the sewage works to generate current for 2,000 sixteen candle-power incandescent lamps, of which 500 are to be distributed among public buildings, and the remaining 1,500 to be furnished to the shops and houses requiring them. Mr. Hawtayne suggests the abandonment of street lighting for the present, or until such time that the profit in the supply of electricity to private consumers will justify outlay on the improvement of public lighting. The current is to be brought from the sewage farm to the town by overhead cables running along the towing-path. The idea of utilising water-power has been abandoned as impracticable. The cost for plant and extension of mains is estimated at 10,450*l*.

VARIETIES.

IT was feared that the breaking up of the ice would endanger the foundations of the Auld Brig o'Ayr, and in consequence it was closed to the public. The *Scotsman* says the venerable structure was barricaded only on the afternoon, when the ice came down on the breaking up of the dam. The bridge appears to have sustained no damage, and has since been opened to the usual passenger traffic. It seems strong enough to be able to repeat the prophecy—"I'll be a brig" when some others are "a shapeless cairn."

THE *Glasgow Herald* says:—The effects of the underground workings on the estate of the Duke of Hamilton are being felt afresh by numerous proprietors in the west end of the town of Motherwell. The Burgh Buildings are also showing traces of renewed subsidences. The front elevation of the Council Chamber has been rent from top to bottom by a crack half an inch wide, and the burgh offices have also been damaged to a serious extent internally.

AN inquiry has been held at the Halifax Town Hall relative to the application of the Corporation to borrow 100,000*l.* for gasworks extension. The proposed extension will be on a site adjoining the present works, on the westerly side of the Hebble. A further inquiry was held as to the application to borrow 14,000*l.* for sewage disposal.

AT the meeting of the Birmingham Association of Students of the Institution of Civil Engineers, Mr. A. P. Maddocks, of Mason College, read a paper on the "History of Bridge Building." The paper dealt with examples of bridges dating from prehistoric times down to the present day, and was illustrated by etchings of many very interesting bridges all over the world.

AN inquiry has been held by the Local Government Board in respect of an application by the Mansfield Town Council to borrow 25,000*l.* to provide an increased water-supply. The scheme has been prepared by Mr. Hodson, C.E., and recommended for adoption by Mr. J. Hawksley, C.E.

THE Northampton School Board have decided to apply for a loan of 10,400*l.* 18*s.* from the Public Works Loan Commissioners to defray the cost of the erection of the new school buildings in Stimpson Avenue, in detail as follows:—Building, 8,439*l.*; furniture, 896*l.* 18*s.*; architect's commission, &c., 835*l.*; other expenses, 240*l.*

AN inquiry was held on January 19, at the Local Board Offices, Leyland, by Mr. F. H. Tulloch, C.E., on behalf of the Local Government Board, into an application made by the Leyland Local Board for powers to borrow 3,388*l.* for the following works:—Extension of the sewerage system, rebuilding of a bridge over the river Lostock, works of improvement in reconstructing main roads, also for works to augment the Board's water-supply for the district. These works were stated to be necessary, mainly owing to the growing requirements of the district. The Board's engineer (Mr. Wm. Wrennall, C.E., of Liverpool), gave particulars of the estimates and explained the plans for the various works. The Inspector afterwards visited the sites and the inquiry ended.

THE Nottingham Town Council propose to borrow 47,383*l.* to carry out certain public works in the borough, including 20,500*l.* for street improvements, 17,000*l.* for purposes of sewage disposal, 6,872*l.* for providing police stations, public libraries, a reading-room and mortuary, 3,000*l.* for laying out the Bath Street Recreation Ground, 1,900*l.* for museum and other purposes and 1,111*l.* for providing a disinfecting station. An

inquiry has just been held, and in the absence through indisposition of the town clerk, Mr. F. B. Harris, Mr. Arthur Brown, borough engineer, explained the plans.

THE site of the proposed new harbour at Ravenscraig, Kirkcaldy, has just been surveyed by engineers on behalf of the North British Railway Company. The estimated cost of the proposed works is 300,000*l.*

AT the sitting of the Manx Tynwald Court a report from a committee was read recommending the carrying out of important harbour works at Douglas, Ramsey and Peel.

AT the annual meeting of the Mason College Engineering Society, Birmingham, Mr. R. J. Richardson in the chair, a paper was read by Mr. Charles Hunt, C.E., on "Gas-making Plant." The paper described in detail the most modern methods of gas production and purification, such as those adopted by the Birmingham Corporation.

MESSRS. HUDSON & KEARNS write us:—"We are very much obliged to you for your kind notice about our diaries, which appears in your paper of the 13th. You have, however, printed our name as Kearns, instead of Hudson & Kearns, and as our diaries now for some twenty years have been known as Hudson & Kearns' architects' diaries, it may possibly cause a little confusion. We are afraid it will be trespassing on your kindness to note this, but if you would do so for us we should appreciate it."

GREEN DRAGON, WINCHMORE HILL.

WINCHMORE HILL was once a border village of the great Chase Forest, one of the last remnants of which is the Winchmore Hill Wood, through which now runs a public footpath for about three-quarters of a mile, and which is certainly one of the prettiest walks in Middlesex. Tom Hood, the poet and humourist, resided some years in a villa some two hundred yards from the Green Dragon. In his poem, "Our Village," many of the objects depicted may still be recognised at Winchmore Hill. Thus he wrote, "There are plenty of public-houses, but the Green (Man) Dragon is reckoned the best, as it is the only one for love or money can raise, a postilion, a blue-jacket, two deplorable lame white horses, and a ramshackle, neat post-chaise." Probably the new Green Dragon will, like the old one humorously spoken of by Hood, be reckoned one of the best public-houses in the northern suburbs, by the many who are attracted each year by the lovely scenery which is to

be met with in that part of Middlesex. In re-erecting the building to meet the needs of the increasing number of visitors the whole premises have been enlarged. On the ground floor are spacious public and private bars, and also private sitting-rooms, &c., and on the first floor a coffee-room capable of seating 150 persons is provided, besides a private dining-room and other apartments; the verandah is entered from this coffee-room. The second floor is occupied by bedrooms, and also the kitchen, &c., are on the upper floor. The building is erected of red bricks, and covered with brindled Broseley tiles; the hay-loft over stables and the gables to main building have half-timbered and rough-cast treatment. The contract was taken by Mr. S. Goodall, of Stoke Newington, who has carried out the work in a very creditable manner; the bar-fittings and pewterer's work are by Mr. Heath, of London; Messrs. J. & J. King, of Norwich, supplied the stained-glass; Messrs. Waygood & Co., the dinner-lift; Messrs. Yates, Haywood & Co., the stoves and encaustic tiles. The plans were prepared by and the works have been carried out under the superintendence of Messrs. George J. Skipper, F.R.I.B.A., and F. W. Skipper, architects, of Norwich.

THE SANITATION OF SCHOOLS.

THE Education Department issued on Saturday to inspectors of schools a circular, and a form to be filled up by them in future at the annual inspection of schools. The form contains some thirteen questions, most of which refer to the site, structure, ventilation and sanitation of the school inspected. The following is the text of the circular:—"My lords are desirous of obtaining a fuller and more detailed statement than is given in the annual reports of Her Majesty's inspectors with reference to the condition, as regards buildings and apparatus, of each of the schools in England and Wales. I am, therefore, to request that you will, at each of your annual visits to schools during the year beginning February 1, 1893, complete and file with form 10 one of the accompanying forms. It is, of course, not to be understood that in every case where the school is to some extent defective in one or more of the points mentioned in the form you are required to press for an immediate alteration. In that matter you will, as heretofore, use your discretion. At the same time, any serious defect in the convenience of the school for teaching purposes or in its sanitation should be brought under the notice both of the

managers and of the Department, with a view to its immediate removal. The object aimed at by the form is twofold—first, the answers to the questions are intended to show, with the view of enabling the Department within a reasonable limit of time to secure complete efficiency, how far each existing school falls short of modern requirements in any of the points mentioned; and secondly, they will furnish a complete statistical record of the condition of the school premises throughout the country. Those answers should not, therefore, be modified by any special circumstances affecting a school, or by the fact that it may formerly have received a building grant."

WESLEYAN CHAPEL BUILDING.

THE annual report of the Wesleyan Chapel Committee, about to be issued, shows that the ordinary income of the fund from collections, subscriptions, &c., is 8,933 $\frac{1}{2}$ l. The relief loan fund amounts to 46,000 $\frac{1}{2}$ l., and the erections loan fund to 50,000 $\frac{1}{2}$ l. During the past year a total of 14,505 $\frac{1}{2}$ l. has been advanced from these two funds. Since the last report the committee have sanctioned 355 cases in all—viz. 120 chapels, at an estimated cost of 167,584 $\frac{1}{2}$ l.; 20 ministers' houses, 18,734 $\frac{1}{2}$ l.; 17 school-rooms, 12,677 $\frac{1}{2}$ l.; 111 alterations and enlargements, 53,059 $\frac{1}{2}$ l.; 53 modifications of cases previously sanctioned, viz. 32 chapels, additional outlay, 12,598 $\frac{1}{2}$ l.; three ministers' houses, 467 $\frac{1}{2}$ l.; 18 alterations and enlargements, 3,698 $\frac{1}{2}$ l.; 34 organs, 9,919 $\frac{1}{2}$ l.—making a total estimated expenditure of 278,736 $\frac{1}{2}$ l. The proposed new chapels, with the enlargements and other works, will give sitting accommodation for 21,290 additional persons. The temporary debt sanctioned is 47,916 $\frac{1}{2}$ l. During the year 319 other cases have been reported through the district synods, upon which 309,204 $\frac{1}{2}$ l. have been expended. These are now returned as completed cases, and the additional accommodation represented in these returns is 21,199 sittings. A number of valuable gifts of chapels and other trust property has been reported. The debt, including loans from connexional funds in process of repayment, is stated to be 808,767 $\frac{1}{2}$ l. The total amount expended on Wesleyan trust property and in reduction of debt during the year is 378,137 $\frac{1}{2}$ l. Since the formation of the fund thirty-eight years ago debts have been discharged by local efforts and surplus income grants and loans amounting in the aggregate to 2,169,293 $\frac{1}{2}$ l. The net amount actually contributed in Great Britain this year, as reported, is 292,583 $\frac{1}{2}$ l.

FIBROUS AND FIREPROOF PLASTERING.

RATING OF OWNERS OF PROPERTY IN LONDON.

THE Bill which has been lodged by the London County Council to authorise a new rate upon the owners of property in London contains the following provisions:—

The preamble recites that the burden of the cost of permanent improvements and works effected by the London County Council unduly presses and will press upon the occupiers of houses and tenements within the county unless specially provided for, and that therefore it is expedient that the Council should have power to levy a new rate, as hereinafter provided.

Clause 2 defines "hereditaments" to include all lands, tenements and hereditaments within the county.

The New Rate.

Clause 3 enacts that there shall be leviable in respect of hereditaments throughout the county a rate to be called "The County Improvements Rate," or such other name as the Council may determine, the proceeds of which shall be applicable by the Council as follows:—

1. In providing one-half of the sums required in each year for redemption of stock, or repayment or replacement of money borrowed and expended on capital account, for the purposes of the following improvements, if the same be authorised by Parliament, viz.:—(a) The new central street from Southampton Row to the Strand, with the subsidiary streets and works; (b) the new approach to the Tower Bridge, in the parishes of Bermondsey and St. John, Horsleydown, and (c) the ferry between Rotherhithe and Ratcliff, described in and proposed to be authorised by the London Improvements Bill now pending in Parliament.

2. In payment of the sum required in each year for payment of interest and charges in respect of one-half of the money so borrowed and expended.

3. In providing the sums required in each year for redemption of stock, or repayment or replacement of money borrowed for and expended on any permanent improvements and works of public utility effected, or to be effected, by the Council and charged to capital account, and in payment of the sum required in each year for payment of interest and charges in respect of money so borrowed and expended.

The expression "permanent improvements" in this section means any works of which the Council have power to spread

the cost, and of which they resolve to spread the cost, over a period of at least fifty years.

Estimate for Rate.

Clause 4 provides that the Council, when estimating or revising the estimate of the amount which they will require to raise in each financial year by contributions, to meet the expenditure for general county purposes, shall estimate the amount which may require to be raised by means of the County Improvements Rate, to meet the expenditure to be defrayed out of moneys raised by that rate during the same year, and the amount so estimated shall be taken into account in ascertaining the amounts to be levied by contributions in respect of expenditure for general county purposes, and such estimate shall be open to inspection by any person without payment, and shall be conclusive for all purposes whatsoever.

Collection of Rate with Property Tax.

Clause 5 enacts that, if any agreement is arrived at between the Treasury and the Council with respect to the collection of the Improvements Rate, the following provisions shall have effect:—

Limitation of Rate.

1. The Council may fix and determine in respect of each financial year the amount of the rate in the pound on the gross value of lands, tenements, hereditaments and heritages in the county, which in their judgment will be necessary to produce the amount required to be levied in respect of that year as the County Improvements Rate, and such rate shall be charged upon the value at which such lands, tenements, hereditaments or heritages within the county are assessed for the payment of property-tax, but shall not exceed the rate of fourpence in the pound upon such value. The rate shall be demanded and collected along with the property-tax.

Collection.

2. On or before the 1st day of November in each year, the Council shall furnish to the Commissioners of Inland Revenue a certificate stating the amount in the pound in respect of such value as they have resolved should be levied as the Improvements Rate, and a separate column shall be provided in the Demand Note for Property Tax which shall specify separately the amount to be collected in respect of the Improvements Rate.

3. Every occupier of any lands, tenements, hereditaments,

Contractor to Her Majesty's Government, the Bank of England, &c., &c.,
St. Gabriel's Works, Erskine Street, MANCHESTER.

Shorland's Inlet and Outlet Ventilator every Design.

or heritages, being tenant of the same, and paying the Improvements Rate, shall deduct from the rent payable by him to the landlord, for the time being, an amount in the pound after the rate at which the Improvements Rate is fixed, and every such deduction shall be allowed in the same manner as a deduction from rent in respect of property tax.

Collection of Rate by Rating Authorities.

Clause 6 provides that, in the event of no agreement being arrived at between the Council and the Treasury as to the collection of the Improvements Rate, then the following provisions shall have effect :—

Precepts.

1. The amounts which the Council require to be levied by means of the Improvements Rate may be demanded by the Council by the precepts by which they demand county contributions for the purpose of the County Rate.

Limitation of Rate.

2. The amounts required to be levied by means of the County Improvements Rate shall be stated in the precepts of the Council separately from the amounts required for contributions for general county purposes, or special county purposes, and shall not in the case of any parish or place exceed a sum equivalent to fourpence in the pound on the total of the gross value of the hereditaments.

Places not in Metropolitan Unions.

3. As regards any parish or place within the county not included in the unions subject to the Valuation (Metropolis) Act, 1869, the amount of the contributions required by the Council to be levied by means of the Improvements Rate shall not exceed a sum equivalent to fourpence in the pound on the gross value of the hereditaments in such parish or place, according to the Valuation List for the purpose of assessment for the relief of the poor.

Collection.

4. The several authorities and persons empowered to levy and collect the county rate shall levy and collect the amount required for contributions under this Act, along with the rate for general county purposes, and in any demand note the amount stated to be levied in respect of the County Improvements Rate shall be distinguished from the amount stated to be levied for other purposes.

Occupier to be Entitled to Deduct.

5. Where the occupier of rateable property in the county is liable to pay a rent in respect thereof, he shall, in the first instance, pay the County Improvements Rate, but he shall be entitled to deduct from such rent an amount in the pound equal to the rate at which the Improvements Rate is fixed; and where a person entitled to receive a rent in respect of which any such deduction shall have been made is also liable to pay rent in respect of the same rateable property, or any part thereof, he shall be entitled in his turn to deduct from any rent payable by him in respect of the same property an equal amount in the pound.

Rating of Unoccupied Buildings and Vacant Land.

Clause 7 enacts that the Improvements Rate shall be assessed and payable in respect of unoccupied houses and buildings and of vacant land, including land on which there are uncompleted buildings, as well as in respect of houses and buildings which are occupied, and of other land, and shall, so long as the house, building or land upon which the rate is charged remains unoccupied or vacant, be payable by the owner thereof on demand. If and so far as at the commencement of a new tenancy or occupation of any house or building or land any arrears of the Improvements Rate remain due in respect thereof, then such arrears shall be payable on demand by the first tenant or occupier, or any succeeding tenant or occupier thereof, and any tenant or occupier who shall have paid such sum may deduct the amount paid by him in respect of such rate out of any rent payable by him in respect of the house, building or land.

Valuation of Unoccupied Buildings and Vacant Land.

Clause 8 provides (1) that the overseers and assessmen committees acting under the Valuation (Metropolis) Act, 1869 shall, in making out the next valuation list or supplemental valuation list, include or add and assess all unoccupied houses and buildings and vacant land, including land on which there are uncompleted buildings, so far as such houses, buildings and land would not, but for the provisions of this Act, be included in such lists, and shall cause the totals of the gross and rateable values of such buildings and lands to be ascertained and included in all valuation lists made after the passing of this Act. (2) As regards any parish or place within the county not included in the unions subject to the Valuation (Metropolis)

Act, 1869, the separate valuation and assessment of uncompleted and unoccupied houses and buildings, and vacant lands, shall be made and prepared in like manner as for the county rate.

Right of Appeal, &c.

Clauses 9, 10 and 11 merely extend the existing right of appeals against the valuation made in respect of unoccupied buildings and vacant land, and also extend the provisions of the Local Government Act, 1888, so far as they are applicable to raising the rate for county purposes, to the raising of the County Improvements Rate, and also provide for the Council keeping separate accounts of the sums raised by the Improvements Rate.

No Power for Landlord to Contract Himself out of the Rate.

Clause 12 enacts that the County Improvements Rate shall be a charge and encumbrance on the freehold of the hereditaments in respect of which it is made, and shall not be a rate or outgoing payable by a tenant or occupier within the meaning of any existing contract. Any deed, agreement, covenant or contract made after the passing of this Act, purporting to deprive or which would have the effect of depriving, any tenant or other person of his right under this Act to deduct the Improvements Rate paid by him from the amount of his rent, or tending to defeat the intention of this Act, shall, so far as it purports to have that effect, be void.

BATH MUNICIPAL BUILDINGS.

THE Bath Town Council have adopted the following report by the Municipal Buildings Committee:—Your committee have now received the revised estimate for the south wing of the new buildings in accordance with the altered plans sanctioned by the Council. Messrs. Hayward & Wooster have gone through all the variations from the original drawings, and the result is that the present estimate amounts to 22,525*l.*, an excess of 27*l.* over the former figures. It will be observed that although the length of the wing is diminished, there are considerable alterations in the structure, and some additions to it on the site of the market to supply the accommodation abstracted from the original design and give a wider roadway opposite the abbey. The entrance hall is now under the tower in the High Street front and not on the circular south-west

angle as formerly. The new court room and the council chamber are removed further north so that they now abut against the wall of the present Guildhall. And the jury retiring-room formerly between the new court and the Guildhall is now projected out at the back over a portion of the market site. Mr. Brydon having stated that everything has been most carefully measured and priced out, the committee have no hesitation in recommending that contracts be completed with Messrs. Hayward & Wooster on the basis of the present estimate, and that the work be commenced as soon as possible. Considerable progress has been already made in the demolition of houses opposite the abbey. The necessary order has been made by the Recorder for closing Boatstall Lane. The committee further report that Mr. Brydon has submitted for their inspection the revised plan of the north wing, and that he hopes they will be completed in the course of next week, so as to be submitted to the Council at the February meeting.

TECHNICAL TRAINING FOR PAINTERS.

THE national united conference of masters and workmen belonging to the house-painting and allied trades was held on Monday, Tuesday and Wednesday of last week, at the Painter-Stainers' Hall, Little Trinity Street, E.C.

At the inaugural meeting on Monday evening Mr. Harris Heal, master of the Painter-Stainers' Company, who presided, alluded to the history of the company, and described its connection with the art of painting in the past, and what it had done to assist members of the trade financially. He also referred especially to the importance of technical instruction, and instanced the Lord Mayor, who, as the Master of the Plumbers' Company, the one company which had taken up the question of registration in the trade it represented, had aided the company in the question of technical education.

The Lord Mayor replied the work they were undertaking was the work that he should be glad to see undertaken by every guild in the City of London. The Plumbers' Company, of which he was the Master, had been most successful in the steps which they had taken to improve the trade by issuing certificates after examination, and he was glad to hear a suggestion that the Painter-Stainers' Company proposed to follow a similar course. He thought that the painter's craft was one that should be especially encouraged to take its proper place as an art. The technical worker in painting should be an

MERRYWEATHERS' "COMPACT" FIRE HYDRANTS.

AS USED AT THE HOTEL METROPOLE (LONDON AND BRIGHTON), ALBERT PALACE, &c.

The "COMPACT" has following advantages:—

- 1.—It is a perfect Hydrant without packing.
- 2.—It takes up least possible space.
- 3.—It has large clear waterway.
- 4.—It is all gunmetal, and can be had with screwed or instantaneous outlet, and screwed or flanged inlet.

artist in his own way, and decorative painting should be treated in a manner pleasing to the eye and to the senses, and devoid of all vulgarity.

Mr. W. G. Sutherland, of Manchester, read a paper on "The Need for Better and more Systematic Training in the Painting Trade," and pointed out that while in the North of England and in Scotland the plan of indenturing boys to the trade had been adhered to, in the Midlands and the Southern counties the plan had fallen into disuse. Left to their own resources boys entered the trade, and were allowed to pick up their knowledge in any way, ultimately drifting into the big army of inefficient. The readiness with which a superficial knowledge of the trade was acquired acted as a stimulus to men to fly to it as a resource when other means failed. What they stood in need was that learners should be thoroughly instructed in a knowledge of their materials; that they should be familiar with the best methods and processes employed in the trade; that attainment to a certain standard of knowledge and executive skill entitled them to a certificate of qualification; and that the diploma should bear the imprimatur of a London organisation representative of the trade and possessed of sufficient authority and prestige to give a distinctive value to the certificate.

Sir A. K. Rollit, M.P., who next spoke, advocated the establishment of commercial museums, and observed, in regard to technical education, that no one could see what had taken place in other countries without feeling the need of greater technical education in our own.

Mr. Joseph Rogers (Battersea branch of Amalgamated Society) said Mr. Sutherland's paper exactly pictured the present condition of the trade. The blame could, he thought, be laid entirely on the employers.

Mr. H. Barker thought the sole cause of the present condition of the trade was due to the employer. Technical education was all very well, but there were many men of good ability who had no opportunities for displaying their powers. If employers were content to take less profit, men would be able to take more time, be better paid, and do sounder work. All the jerry building and rascality of the capitalist class was due to the present competition system.

Mr. W. H. Bailey, of Hull, said that the problem to be solved was how to bring back the demand for good work, so that when greater ability was displayed there would be opportunity for employing it. If the masters were determined to assist the men, they could rely on being heartily supported.

Mr. J. Puttrel, of Sheffield, as an employer, said while masters were responsible for some of the blame, a portion also attached to the men. Masters were desirous of having work done well, but they were often thwarted. If workmen and masters would only pull together they would, however, be more successful.

Mr. A. Purser, Universal Federation, said one reason for the disreputable work done was the low estimates put in, and the sub-contracting below that, whereby to recover ground a coat of paint had to be omitted.

Papers on "How Best to Stimulate an Interest in our Trade in the Young," contributed by Mr. Thomas Lough, M.P., and by Mr. W. A. Stewart, of the London Trades Council, were next read. The latter laid the blame of the general lack of interest amongst youths in technical details on the modern system of cramming adopted in our schools.

On Tuesday evening Colonel Robert J. Bennett, of Glasgow, presided. He advocated the development of evening trade classes for apprentices and operatives. A paper on "Trade Classes and their Management" was read by Mr. T. C. Millis, head-master of the Borough Road Polytechnic. He showed the increasing necessity for the establishment of trade classes, owing to the decadence of the apprenticeship system, and said the object of such classes should be to supplement and not to supersede the training gained in the workshop. To be successful, these classes must be heartily supported by the workmen.

Mr. William Fourniss, of Finsbury College, on the same subject, said the painting and decorative trades did not now hold the same position in public estimation they once did, partly because of the steady decline in apprenticeship, partly because of the lack of technical training in the workers, and the consequent falling off in average ability. The painters' trades unions ought, he urged, to seek to raise the level of the work done.

Mr. Donaldson, late of Gillow's, said apprenticeship was in London practically dead. The metropolitan employer wanted the finished article, and had no time to train raw youths, nor had he any necessity to do so, for there was a continuous supply of trained men flowing in from the provinces.

A long and exciting discussion followed from both workmen and employers. Mr. Joseph Rogers, of the Battersea branch of the Amalgamated Society, questioned whether a man possessing the highest technical knowledge of the principles of his trade would be treated with greater respect by an employer,

and asked whether it was not the fact that such educated and skilled men were displaced by those who would scamp the work?

Mr. Sutherland deprecated recriminations on either side, as likely to destroy any hope of utility from the conference. Ultimately the workman who deserved respect for his superior ability and knowledge would gain it. An architect had told him that day that he had often to select a workman little better than a labourer, because he had a better perception of colour than others who perhaps possessed greater technical knowledge, and could more intelligently carry out orders.

Mr. Edward Bell, of Kentish Town, as an employer, held that all practical master painters knew the value of a skilled man and treated him accordingly; but the few employers of this sort in London were swamped by the large number of men who had come into the trade as a mere means of living, and who would take contracts, often at less rates than the cost of labour and materials.

After remarks from Mr. M. C. Cowtan, of Oxford Street, Mr. G. W. Argent, Regent's Park, Mr. Barker and Mr. W. E. Steward, Mr. Millis, in replying upon the discussion, expressed regret that at this and all other conferences on technical education he had attended, consideration of the main issue had been impeded by discussions of the existing relations between employer and employed.

Papers on "Is it desirable to establish a System of Registration and to grant Diplomas of Merit?" were read by Messrs. David Laing and George Kilpack. After discussion the following resolution was unanimously adopted:—"That in the opinion of this conference it is desirable that some system of registration for masters and workmen be established."

On Wednesday evening Mr. J. Hunter Donaldson presided. In the absence of Mr. J. D. Crace, through illness, a short paper on the prospects and position of the craft was read for him by Mr. Sutherland. Two papers entitled "Proposals for Establishing a New Organisation" were then read, the first by Mr. A. Chappell, and the second by Mr. A. Gaiger.

After a stormy discussion the following resolution was adopted:—"That in the opinion of this conference it is desirable, in the interests of the painting trade, that there be some central organisation (with auxiliary branches throughout the country), possessed of sufficient prestige and authority to issue diplomas or certificates of technical ability to candidates for the same, whether masters or men; that it be the respectful petition of this conference to the master, wardens and court of

the Painters' Company that the court takes into its earnest consideration the question whether it would not be possible for the company to provide facilities for giving effect to the above; and that a consultative committee, consisting of an equal number of employers and workmen, be appointed from this conference to meet and confer with a committee of the company, and to issue a report thereupon to the individuals and societies represented at this meeting," and the following were appointed as a committee to co-operate with the court of the Painters' Company:—Messrs. George Kilpack, E. C. Gibbs, Foy, Chappell, Yallop, J. Laing and M'Dowall, with power to add to the committee.

PATENTS.

THE DENSMORE. THE WORLD'S GREATEST TYPEWRITER.

TO ARCHITECTS.—If you have come to the conclusion that the use of a Typewriter for writing your Specifications and Contracts will SAVE YOU TIME AND MONEY, give the DENSMORE a thirty days' trial before purchasing any other.

The Machine may then be returned if not found satisfactory in every respect, and a decided advance in typewriting mechanics.

If you decide to purchase it, we guarantee it free from all mechanical defects, and keep it in order for two years free of any charge.

TWO CARRIAGES, fitted with SOFT and HARD CYLINDERS, which are instantly INTER-CHANGEABLE, are furnished with each Machine without extra charge—thus one DENSMORE performs the work of two ordinary machines.

NO LIFTING OF CARRIAGES REQUIRED IN ORDER TO SEE YOUR WORK.

If you require anything in Typewriting Supplies, give us a call and look over our stock. We have seventy-five different grades of Typewriting Papers and a large stock of the best Carbon Papers. Typewriting of all kinds neatly and promptly executed by a corps of skilled operators.

The Densmore Typewriter Co., Ltd.
51 GRACECHURCH STREET, E.C.

Tuition Free to Shorthand Writers on application at Office. Telephone No. 11,321.

**ELEVENTH ANNUAL
BUILDING EXHIBITION**

Of all Industries connected with the

Building Trades,

MARCH 11 to 25, 1893.

"THE ARCHITECT" says of the 1892 Exhibi-
tion:—

"The representatives of all industries connected with the
building trades will be wise to commence at once their pre-
parations for the Exhibition. There cannot be as loud a pre-
liminary flourish about an Exhibition in Islington as there is
always about one of those designated as "international";
but if exhibitors will consider the results of the two classes,
they will discover that in the former they have met men of
business and received orders, while for the privilege of par-
ticipating in the universal show they have not only lost
large sums, but discovered that the *dilettanti* and holiday
makers, who constitute the mass of visitors, are not fasci-
nated by the best aids to construction."

JOHN BLACK, Secretary.

Exhibition Offices: 2 Newcastle Street, Strand.

CHICAGO EXHIBITION NOTES.

THE educational section of the Chicago exhibition will contain several interesting contributions by the School Board of Glasgow. The principal exhibit consists of the plans of Adelphi Terrace Public School, now in course of erection. When completed, this school, it is considered, will be the premier establishment of the kind in the city. The architect is Mr. T. L. Watson, whose design was selected as the result of a competition, and the various views given of the school, which comprise the basement, ground, first and second floors, longitudinal and transverse sections, and front and end elevation perspective, are presented in such a form as to convey a very adequate idea of what is being done in Glasgow in the way of school buildings.

THE committee of the Birmingham Art Gallery and Museum have granted, through the United States Commission, the loan of the Woolrich electric machine, now at Aston Hall, to Messrs. J. E. Hartley & Son, of St. Paul's Square, who will exhibit it at the World's Columbian Exhibition. As the forerunner of all the magnificent dynamos now so extensively used, this relic cannot fail to excite much interest in the United States, where Faraday's great discovery has had so many practical applications.

THE work of Public Elementary Schools is to be exemplified at the Chicago Exhibition by a display prepared by the London School Board. There will be models of London Board Schools, plans and elevations, drawing copy specimens, a museum cupboard removed from a London Board School, apparatus and books illustrating science teaching in the London Board Schools; examples of Kindergarten work and clay modelling, cardboard modelling, copper, brass and woodwork, &c.

With Lifting Fire.

WORKS, ROTHERHAM. Estab. 1854.

THE following articles have been despatched this week from Sandringham to the Chicago Exhibition:—The Princess of Wales sends a beautiful corner chair in carved oak and cut cow-hide; the oak carving is by pupils of the Sandringham Technical School, and the leather was cut by her Royal Highness according to her own design. The Princess Victoria of Wales has forwarded a music-stool, with box-seat for books, &c., constructed to her designs in carved oak by the same school, and has worked the cut leather herself in single dahlias. Princess Maud of Wales has despatched a similar stool without the box-seat, and has herself worked the cut leather in sunflowers.

BUILDING AND BUILDERS.

AT the meeting of the Glasgow Dean of Guild Court, authority was given for the erection of over twenty tenements of dwelling-houses, besides a number of self-contained villas, within the city boundaries. The School Board of the parish of Eastwood were authorised to erect a new school at Shawlands, and the Corporation were granted leave to erect stables and workshops in Kelvinhaugh Street, Rowchester Street, Hozier Street and Baltic Street, in connection with their taking over of the tramway system in the city.

THE *Lincoln Chronicle* says it may now be taken as definitely settled that the new theatre will be erected on the site of the old structure. The proposed building will cover the site of the old Theatre Royal, and will also be extended over the King's Arms yard and the stables attached to the inn. Mr. Frank Matcham, London, is the architect.

ON Monday this week the Lord Mayor opened new premises, which have been built for the London Shipping Exchange, in Billiter Street, City, in place of the old Jerusalem. Messrs. Cubbitt, builders, carried out the work under the direction of the architect, Mr. Alex. R. Stenning.

AT the meeting of the sub-committee of the Leith Town Council, appointed to examine plans for the proposed new fever hospital for the burgh at East Pilton, plans for a fever hospital, to be erected on the cottage plan, were submitted by Mr. Simpson, architect. Mr. Simpson estimated that the buildings would cost about 20,000*l.*, and general furnishings, &c., about 4,000*l.* more, exclusive of the cost of the site, for which upwards of 3,000*l.* have been paid. The committee approved of the plans, with some slight alterations.

VARIETIES.

THE Queen has accepted a copy of Miss Whitmore Jones's book on "Games of Patience," which contains instructions for playing more than a hundred different games.

AT a joint meeting of the Technical Education and Public Meetings Committees of the Glasgow and West of Scotland District Council (Registration of Plumbers), held in Glasgow, Mr. David Thomson, architect, presiding, arrangements were advanced for the lectures to be delivered this session. Dr. Neil Carmichael, Examiner in Public Health to the Faculty of Physicians, is to deliver the first of those lectures in the end of February, treating the subject from the standpoint of a medical man and a sanitarian, while Mr. John Honeyman, F.R.I.B.A., will lecture in the end of the following month from the architectural side.

THE St. Helens Corporation are about to apply to the Local Government Board for sanction to the borrowing of 3,000*l.* for water-main extensions.

IT is stated that it has become necessary to line the Cynnyon tunnels, near Oswestry, on the Liverpool Vyrnwy pipe-line, with bricks, owing to a defect in the rock through which the tunnels are bored.

THE iron swing bridge erected by the Manchester Ship Canal Company to replace the old stone bridge which crossed the Irwell at Barton and connected the disturnpiked roads of that township with those of Stretford, Urmston and Flixton, has been temporarily opened for traffic. The Mayor of Eccles and several members of the Town Council met Mr. Radford, the county bridge master, and Mr. Charles Parker, resident engineer of the Ship Canal, on the new structure. It is expected to be ready for opening about June next. Messrs. Handyside & Co., Limited, are the contractors for the bridge.

AN inquiry has been held as to the application by the Southport Corporation for power to borrow 22,000*l.* for the improvement of the foreshore. The scheme includes the construction of a carriage drive on the seaward side of the south marine lake and the connection of the two lakes, to be spanned by an ornamental bridge. The foreshore enclosed by the drive is to be laid out as a marine park.

THE usual exhaustive and elaborate annual report on the meteorology of Nottingham by Mr. Arthur Brown, the borough engineer, and Mr. Philip Boobyer, medical officer of health, has just appeared. The health statistics of the borough may be

studied with advantage in connection with the meteorological details scientifically shown on the accompanying chart.

THE Highgate Museum of Sanitary Appliances, which was recently opened by the Lord Mayor, was on Saturday last visited by Dr. F. J. Allan, medical officer of health for the Strand Board of Works, and the Shoreditch Vestry, accompanied by nearly thirty medical gentlemen. Great interest was taken in the museum, and the visit was much appreciated. The number of visitors during the past five weeks has been 2,162.

TRADE NOTES.

MESSRS. ARCHIBALD SMITH & STEVENS have received instructions to erect one of their Reliance passenger lifts in Jury's Hotel, Dublin, which is undergoing partial reconstruction. The same manufacturers have in hand a hydraulic lift for Messrs. Power & Co.'s distillery, Dublin; a handsome passenger lift for Mr. Peter Robinson's Regent Street show-rooms, London; a hydraulic lift for Messrs. J. & J. Field & Co.'s new factory, Lambeth; passenger and other hydraulic lifts for the Derbyshire Royal Infirmary, together with several large hydraulic passenger lifts for various buildings in the City of London.

MESSRS. BAIRD, THOMPSON & CO., ventilating engineers, of London and Glasgow, send us a copy of their new sheet of designs, calendar, &c., which they are issuing. The reverse side of the calendar is prettily got up in primrose and gold, and is a reproduction of the Grand Diploma of Merit (accompanied by the gold medal) this firm received at the Brussels Exhibition, at which exhibition they were granted the highest award for ventilators and ventilating appliances. We may mention that this firm has received the highest awards (1887-88-89-90-91-92) for improved systems of automatic and mechanical ventilation and ventilating appliances, *i.e.* fifteen gold medals and three grand diplomas of honour, having never been beaten at any exhibition.

TWO new fire-engines have been supplied to the Liverpool Watch Committee by Messrs. Merryweather & Co.

THE new hospitals, Devonport, are being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke-flues, the same being supplied by Mr. E. H. Shorland, of Manchester.

TO meet the requirements of amateur and other photographers Messrs. Marion & Co. have brought out "Marion's

New Fixing Cartridges," for fixing plates. These cartridges consist of pulverised hyposulphite of soda and theonine in correct proportions, and packed in specially prepared tubes. Being in powder they dissolve very quickly, and their portable form specially commends them to travellers and tourists.

THE North London Railway have decided to light the whole of their carriages with the "Coligny" lamp (the new patent gas roof-lamp, of the Lamp Manufacturing Co., Limited, Leonard Street, City Road), constructed upon a new principle, which gives a very largely increased light for the present consumption of gas. The North London Railway have already one train fitted with these lamps, and the company hope to commence fitting their carriages with them in the course of this month.

A SERIES of descriptive geometry models for the use of students in schools and colleges has been designed and brought out by Mr. Thomas Jones, gold medallist, member of the Institution of Mechanical Engineers, of 27 Barton Street, Moss Side, Manchester. They are a wonderful production, at the low price of 1s. 3d., and will serve for many purposes as well as more expensive solid models.

PLANS have been prepared for an extension of the Rubery Hill Asylum, which will cost 25,000*l.* The asylum is controlled by the Birmingham City Council.

THE tender of Messrs. Morrison & Mason, Limited, to construct the Blackrigg section of the new aqueduct from Loch Katrine to Glasgow for 86,700*l.*, has been accepted by the Glasgow Corporation. The highest tender was £99,000, and there were one or two offers lower than the accepted one.

WE are informed that plans for the superstructure of the Liverpool Post Office in Victoria Street will not be ready for another month, when tenders will be invited. About six months may elapse before the acceptance of a tender is notified.

AN inquiry has been held at Holyhead into the application of the Anglesey County Council for sanction to borrow 3,000*l.* for the erection of a new police station at Holyhead.

THE Port Glasgow Town Council have accepted the offers from the various branches of trade in connection with the proposed baths and washhouses, for which Mr. Joseph Russell, shipbuilder, gave 5,000*l.*, viz:—Mason and brickwork, Mr. William Steel, Greenock; carpenter and joinerwork, Mr. William Fyfe; slaterwork, Mr. Ninian J. Gillespie; plumberwork, Messrs. Wm. Wilson & Sons; gas-fittings, Messrs. Brownlee & Co., all of Port Glasgow; iron piping and washing and drying apparatus, Messrs. Murdoch & Cameron, Glasgow;

ironwork, Messrs. P. & W. McLellan, Glasgow; painterwork, Messrs. Macfarlane & Co., Glasgow. The architect is Mr. J. B. Stewart, Greenock. The cost will be about 4,000l.

AUTOMATIC AND MECHANICAL VENTILATION AND SANITATION.

ONE of the most original systems for the efficient ventilation of private and public buildings, &c., is that of Messrs. Baird, Thompson & Co.'s latest improved patent combined system of automatic and mechanical ventilation and warming. This new invention has the merit of diffusing pure fresh air through the largest buildings, accompanied by complete ventilation, and is free from dust and effluvia or other offensive properties. This system from one source and centre is capable of easy regulation and of producing the same or different degrees of temperature in various compartments of the same building. These are advantages of the first importance in churches, schools, public halls, mansions, &c., and the Baird-Thompson system insures purity of air as well as efficiency and economy. This new system has already made a reputation, but its merits both of comfort and economy cannot be too widely known. This system of ventilation is adapted to hospitals, churches, schools, public works, mines, ships, sewers, &c. An important feature in this firm's system is that it can be adapted to existing buildings as well as new ones without any great trouble or expense.

ELECTRICAL.

AFTER protracted investigation the Lighting Department of the Bolton Corporation have decided upon a scheme of electric lighting and to secure power to borrow 40,000l. to carry out the undertaking.

THE arch roof of the chamber leading to the electric light station in the north terrace at Windsor Castle has been opened preparatory to some alterations which are about to be made in the machinery of the palace installation.

AT the last meeting of the Edinburgh Literary Institute Mr. E. A. Browning gave a lecture on "Electric Light in our Homes." After a reference to other methods of illumination, such as oil and gas, he said that a perfect light should not consume the oxygen in the room, it should not add noxious

fumes to the air, it should not be a source of danger in the house, it should not be an unpleasant light, it should not be difficult to control, and it should not be too costly. These conditions were, he demonstrated, all fulfilled by the electric light. In London it cost about three times the price of gas, in Newcastle-upon-Tyne about one-third more, and in Dundee about one-half more. But this additional cost was returned to the consumer, as there were no blackened ceilings or wall-papers soiled, and better health followed its use.

AN inquiry has been held by the Local Government Board at Blackpool concerning the application of the Corporation to borrow 26,000l. for the purposes of electric lighting in the borough. A further application to borrow 9,590l. for the store yard and 1,500l. for sewage works was also gone into.

ELECTRIC LIGHTING.

IN his presidential address to the Institution of Electrical Engineers, Mr. W. H. Preece said that the rapid development of electric lighting had been seriously retarded in England by the operations of a monster called into existence by the limited liability legislation of recent years, the rapacious financial promoter, whose plunder in one year of our period far exceeded in amount the sum of all the thefts of all the highwaymen and burglars that were ever hanged. He had ruined the prospects of private enterprise and had rendered absolutely necessary the Acts of 1882-88, which had thrown the industry into the hands of the local authorities of our cities and boroughs. The glow-lamp had been greatly improved, and as this year would witness the expiry of the controlling master patent, we should see the price reduced to something not far from 1s. Some could remember the time when the price was 25s. It had now for some time been 3s. 9d. As a glow-lamp cost only 9d. to make it might reasonably be hoped that his anticipation would be realised. The cost of wiring was a great deterrent to the introduction of the electric light into small tenements and into houses held on short tenures. The materials used must be of the most perfect kind, otherwise insecurity was incurred; but there were expensive practices of wood-casing and of ornamentation which wanted reform. The Cheap Jack was the curse of the industry, and the absence of specification and of inspection the danger of the user. The fire-insurance offices had maintained our practice in England pretty secure, but in other countries the character of the work had been very indifferent, and even horrible. The

problem of economic distribution had been much simplified by the introduction of the three-wire system by Dr. John Hopkinson, and by the improvements made in high-pressure apparatus. High-pressure not only economised the heavy cost of mains, but simplified immensely the mode of regulation. The early pioneer alternate-current systems, which had done so much to further the development of electric lighting, were, however, costly in their coal bills, owing to great losses of energy in their iron and copper, but the transformer of the present day was as perfect in efficiency as the dynamo. These losses had practically disappeared, and modes of switching transformers in and out at will had removed every difference of cost between high-pressure and low-pressure systems. The prejudice against high-pressure was still strong, but time and experience would eradicate it, as they ultimately eradicate every fallacy. The progress in electric lighting was now principally economical. The cost of production of electrical energy was rapidly coming down. Elements of waste were being eliminated, and continuous working throughout the day and night was being encouraged. If a full load could be maintained during the whole twenty-four hours, electrical energy could be manufactured for one-third of a penny per supply unit, and this was equivalent to gas at 2d. per 1,000 cubic feet. The potentiality of economy in electric lighting was thus beyond the dreams of the gasman. The most marked features in the development of this great industry were the ostrich-like blindness of the gas-manager, who buried his foresight in his fat dividend, and the childish wailing of their technical journalists. The gas industry should itself have nursed this herculean infant, who was rapidly strangling one of its main sources of profit. Fortunately for the gas shareholder, there were other sources of income—warming, cooking, motive power—to be developed. Our corporations and local authorities were showing more astuteness. Manchester, Nottingham, Dewsbury, though successful gas producers, had assumed also the position of undertakers of electrical energy. Electric lighting, carried out under the provisions of the Acts of 1882 and 1888, was a self-supporting, self-managed and profitable industry. It was a business of a mutually co-operative character, carried on by the ratepayers themselves for their own sole benefit. Nothing would stop the growth or prevent the rapid spread of this beneficent and sanitary mode of illumination into the confined, ill-ventilated, overcrowded homes of the work population. The electric light was essentially the poor man's lamp. Many efforts were being made to utilise the waste

forces of nature in producing electric currents for the economical supply of the light. In America, Scotland, Switzerland, Italy and, indeed, wherever waterfalls were available, electric plant was being installed to convert the energy of the fall into the useful form of electricity. There was much water-power in this country that might be used. There were many towns whose public streets could be brilliantly illuminated by the streams running past them; but there was much fear and distrust to be removed from the minds of our local magnates, and a considerable amount of education was necessary before the public would receive the full value of the gifts that nature so freely placed at its disposal, and the engineer so thoroughly converted into a utilitarian form.

NATIONAL ASSOCIATION OF MASTER BUILDERS OF GREAT BRITAIN.

THIS Association held its thirtieth half-yearly meeting at the Midland Hotel, Derby, on January 24. Mr. J. C. White, the president, presided, and representatives were present from London, Liverpool, Manchester, Birmingham, Nottingham, Leeds, Bradford, Northampton, Hull, Shrewsbury, Bath, Leicester, Derby, The Potteries, Walsall, Huddersfield, Preston and Portsmouth. The chairman reported that during the past half-year there has been a special meeting of the Council, held at Birmingham, by request, to discuss the strike at Cardiff, at which were present representatives from Manchester, Liverpool, Cardiff, Birmingham, Bristol, Kidderminster, Leigh, Ipswich, Walsall, Bath, and Portsmouth, and an unanimous resolution, recording their appreciation of the firm stand the Cardiff master builders were making in the protracted strike at Cardiff was passed by the Council, and the Association pledged to assist them by every legitimate means. That the Council have nothing definite further, at present, to report on the question of the long-debated form of conditions contract, except that a general agreement has at last been arrived at between the Royal Institute of Architects and the Institute of Builders, subject to the opinions of the legal advisers of the respective institutions on the legal bearing of the clauses, and the draft is now in the hands of those gentlemen to settle between them the wording of the clauses in any case in which they may contravene the law. That the Council will, during the approaching session of Parliament, keep a close watch upon

any action that may be taken by the Government, or by private members, in bringing forward Bills which may in any way affect the various interests of the building trades, or the relations between employers and employed.

The Chairman also reported that he had received a communication from the Federated Builders' Association of Australia, which was formed for the protection of the trade, upon lines very similar to the National Association, as they had agreed conditions of contract with the Australian architects, guaranteed quantities, and, under the Employers' Liability laws, they had a builders' insurance, the premium of which was 7s. 6d. per cent. They were also giving their attention to the eight hours question, the apprentice question and to technical instruction.

The report and accounts were read and adopted.

Mr. Robert Dennett (Messrs. Dennett & Ingle), of Nottingham and London, was elected president in place of Mr. J. C. White, of Liverpool, who retired, and Mr. Dennett thereupon delivered his inaugural address, which is given in another column.

Mr. John Bowen, Birmingham, and Mr. T. F. Rider, London, were elected vice-presidents, and Mr. J. C. White, Liverpool, was elected one of the hon. vice-presidents for the ensuing year.

Mr. Jos. Stevenson Jones, Liverpool, was re-elected hon. treasurer and Mr. C. W. Green was re-elected hon. auditor, and the following gentlemen were elected members of the Council:—C. H. Barnsley and W. Sapcote, Birmingham; Joseph Henry Marsden, Bolton; William Moulson and W. Holdsworth, Bradford; A. Krauss, Bristol; Joseph Bell, Cambridge; John Walker, Derby; Thomas Bonnar, Edinburgh; R. Bennett, Glasgow; R. Beevers, Hull; C. Myers and Banks Mawson, Leeds; William Henry Close, Lincoln; J. B. Johnson and Hy. E. Dallow, Liverpool; Frank May and John Burt, London; William Southern and Alderman Wm. Brown, Manchester; W. H. Smith, Northampton; Enoch Hind, Nottingham; James Bowden, Potteries and Newcastle; John Walmsley, Preston; Chas. B. Holmes, Wigan.

A vote of thanks was accorded to Mr. J. C. White for his services as president, to which Mr. White responded. A vote of thanks was also unanimously accorded to Mr. Stanley G. Bird for the evidence given before the Royal Commission on Labour.

It was decided to hold the next half-yearly meeting at Huddersfield.

TREVITHICK'S THAMES TUNNEL.

RALPH DODD, an engineer of some note of the last century, was the first to commence operations for a tunnel under the Thames from Gravesend to Tilbury Fort. His plan was to avail himself of the chalk stratum which he supposed to run under the bed of the river, and he expected that the chalk quarried out would sufficiently pay the expenses of working, leaving its subsequent use as a viaduct to afford a handsome income. He obtained an Act of Parliament for his plan in 1799, with power to raise 30,000*l.*, and to increase his capital in case of need to 50,000*l.*, his estimate being only 15,000*l.* The work was commenced and proceeded for about three years, but was ultimately stopped on account of the expense of drainage. He had gone on the assumption that the chalk would be in one solid stratum, and that he should not be embarrassed by water, having in his estimates allowed only 1,780*l.* for this purpose, and treated the expense as merely contingent. He found, however, such great inconvenience from under-springs rising through fissures in the chalk, that he was obliged to abandon the project. This tended to throw a damp on such plans, and when Trevithick proposed a similar tunnel under the Thames at Rotherhithe, he found a natural reluctance to support any such undertaking. Several of his friends, however, raised a subscription to enable him to make an experiment on a small scale, and the result was anxiously awaited to justify an appeal to the public for carrying out the entire plan. In 1809, therefore, Trevithick was employed in running a small driftway parallel to the bed of the Thames. The committee of subscribers justly felt every assurance of the success of the undertaking, for the operation was extremely simple, while they had entire confidence in his skill and ability, from the experience he had gained in similar underground mining works. Trevithick, to save labour and expense, committed the usual fundamental error of not going deep enough below the bed of the river, the object in his case being a close-run endeavour to keep at the least possible distance from it. Had his experiment been concluded, this would have enabled him to give a plausible original estimate at any hazard of subsequent increased expense. This error, however, was not productive of much inconvenience to him, nor was it the immediate cause of the abandonment of the enterprise, for he carried his driftway to a greater extent without impediment than has been done in any other attempt. It was not until he had gone 930 feet under the river that he

encountered any obstacle, when he got into a hole in the muddy bottom of the river, and at one time a piece of uncooked ship beef, which had fallen from one of the vessels, drifted into the works. Although the Corporation authorities refused to allow him any facilities, he managed to get this hole stopped, and again went on with vigour. He carried on the excavation at the rate of from 4 to 10 feet per day, and soon completed 1,000 feet, to the great joy of every one concerned. On arriving at this distance, according to his previous agreement with the committee, Trevithick was to receive a hundred guineas, which, after a verification of the work by a surveyor, were paid to him. This surveyor was appointed by the subscribers to check Trevithick, and in giving in his report confirming the measurement, stated that the line had been run 1 foot out of the perpendicular. This statement Trevithick took in high dudgeon, and chose to consider it as a deep reflection on his engineering skill to have deviated 1 foot in a thousand. With his usual impetuosity he set to work to disprove the assertion, without any regard to consulting his own interest, or embroiling himself with the committee. Of all possible contrivances for effecting this object he adopted the most absurd, which was no less than to make a hole in the roof of the tunnel at low water, and to push through a series of jointed rods to be received by a party in a boat, and then observed from the shore. Even had he been successful in carrying out this process, it would have afforded no criterion of the precision of the work, as the set of the current would necessarily have swerved the rod. Trevithick was employed in the driftway in carrying out this contrivance, and as delays of course ensued in fitting together the rods, the gully consequent on the opening in the roof ultimately admitted so much water as to render a retreat necessary. With a moral courage innate to his character, and worthy of a better cause, he sent the men on before him, and very nearly fell a sacrifice to his devotion. It has been already observed that the driftway was parallel to the bed of the river, and consequently curved. It necessarily happened, therefore, that the entering water would lodge, syphon-like, in the bottom of the curve, at which part, on Trevithick's arrival, he found so much water as hardly to be able to escape, for as he ascended the slope on the other side and climbed the ladders the water rose to his neck. It is needless to say that this act of rashness was the death-blow to the project, while it added the climax to the many acts of inconsistency with which Trevithick's erratic career was disturbed. On a subsequent occasion, being cross-examined as to this occurrence while

witness on a trial, he admitted the fact of his ruining the works, and his determination in any similar circumstance to defend his own character at whatever sacrifice to other people. The work thus ended after having reached 1,011 feet, and remains within 100 feet of its proposed terminus, a melancholy monument at once of his folly and his skill.

THE MINCING LANE SAFE DEPOSIT.

A GREAT transformation is being slowly but surely effected at the London Commercial Sale Rooms in Mincing Lane, under the auspices of Mr. P'Anson, architect, whose plans are being efficiently carried out by the contractor, Mr. J. T. Chappell.

One important feature, however, has already been realised in the provision of an adequate and handsomely equipped Safe Deposit, constructed by Milner's Safe Company, which is on the point of being opened for the use of the public, who will find an absolutely secure but inexpensive depository for documents and valuables of every description in safes of varying size, immovably fixed in steel-clad and burglar-proof as well as fireproof vaults.

The descent to the vaults is easily accomplished, and we find ourselves in the manager's office, which is contiguous to the spacious and commodious waiting-room set apart for the use of clients, where they can transact their business with comfort. Passing through an iron grille, entrance is afforded to the actual safe deposit, consisting of a huge steel fortress divided into four capacious apartments, the whole being self-contained and impregnable, while there is a space left between the safes and the walls of the vault, to enable the armed patrol to walk round the treasures committed to their custody. Three of the compartments are fitted up with safes, numbering in all no less than 1848, which vary in size from 4½ inches to 14 inches high, with a width of from 7½ inches to 11½ inches, and an uniform depth of 20 inches, the charge being from one guinea to three guineas per annum each. The remaining compartment is adapted as a strong-room for the reception of plate or other bulky valuables. All the four doors are controlled by lever locks of a special construction, which are also fitted with chronometer movements, so that when the locking has been effected and the chronometer set for a given number of hours, the mechanism

acts in such a way that access cannot possibly be obtained until the regulated time has elapsed. The renter of an integer or small safe is furnished with a key, which however of itself does not afford the "Open sesame"; to accomplish this another key in conjunction is requisite, which is known as the "cover," and is always kept in the manager's custody. Eventually and in due time the entire place will be lighted by electricity, while there is an admirable and effective system of ventilation being carried out, for which credit must be awarded to the well-known firm of Messrs. Rosser & Russell.

The decoration of the Safe Deposit, it may be added, is of a superior character, while the accommodation afforded is beyond the ordinary, and the *habitués* of Mincing Lane, together with many others, will doubtless appreciate the latest enterprise of the well-known firm, Milner's Safe Company.

SKY-SIGNS IN LONDON.

ON account of the efforts which have been made to defeat the purposes of the Sky-Signs Act of 1891, the London County Council have inserted a clause in their General Powers Bill of this session in order to repeal the meaning of a "sky sign" as defined in that Act. In the place of that definition, which was directed against the familiar iron structures over the roofs of buildings, the Council propose a more comprehensive definition and the extension of the powers of that Act to any "sky-sign" which shall fall within it. The proposed new definition of "sky-sign" includes "any word, letter, model, sign, device or representation in the nature of an advertisement, announcement or direction supported on or attached to any post, pole, standard, framework or other support, wholly or in part on, over or against any house, building, structure or erection of any kind, including all and every part of any such post, pole, standard, framework or other support." The expression "sky-sign" also includes "any balloon, parachute or other similar device employed wholly or in part for the purpose of any advertisement or announcement on, over or against any house, building, structure or erection of any kind, or on or over any street or public way." The expression will also embrace "any flagstaff, pole, vane or weather-cock, if adapted (but not otherwise) for the purposes of any advertisement or announcement." It will not, however, include "any sign on any board securely fixed to or on the top of a wall or parapet of any building, or to the ridge of a roof, provided that the board or other contriv-

ance be of one continuous face and not open work, and do not extend in height more than 3 feet above any part of the wall or parapet on which it is fixed."

REGISTRATION OF PLUMBERS.

A DEPUTATION, introduced by Mr. W. Watkins, F.R.I.B.A., ex-Mayor of Lincoln, accompanied by Mr. G. J. Dashper, Clerk of the Peace, and Mr. R. A. McBair, City Surveyor, composed of about thirty master and operative plumbers from Lincoln, Grantham and Lincolnshire, recently visited London to inspect the Museum of Sanitary Appliances, and Testing Department in connection therewith, established by the Hornsey Local Board at Highgate. Among the registered master plumbers on the deputation were Messrs. Bocock, Coupland, E. F. Arnold, Boole, &c. The deputation afterwards waited on the Lord Mayor at the Mansion House.

The Lord Mayor, in welcoming them, said he was pleased to learn that the Corporation of Lincoln were doing their utmost to promote sanitary science. He was always happy to welcome to the Mansion House the representatives of bodies interested in sanitary work, especially those coming from a distance, as in the present instance. He was very pleased to see the deputation headed by their ex-Mayor, Mr. Watkins, who was well known in connection with matters concerning domestic sanitation. Referring to the visit of the deputation earlier in the day to the Highgate Museum and Testing Department, which he had the pleasure of opening a short time ago, he said it was undoubtedly a step in the right direction for a public body like the Hornsey Local Board to found, as it were, a museum for the technical study of plumbing work, and the presence of that deputation from Lincolnshire was an evidence that the intelligent and public-spirited action of the Board was already bearing fruit. The Corporation of the City of London prided itself on taking a leading part in all matters concerning the health, not only of the citizens of London and the suburbs, but of the community at large. After enumerating some of the public works carried out by the Corporation outside the City, the Lord Mayor referred to the important public work which the Plumbers' Company were doing in extending the national system for the training, examination and registration of plumbers throughout the whole of Great Britain and Ireland.

Mr. W. Watkins, on behalf of the deputation, thanked the Lord Mayor for the very kind manner in which he

P. A. GILBERT WOOD, 175 STRAND, W.C.

had received them. He said the deputation was composed principally of master and operative plumbers, the other members of it being architects and surveyors, who took a keen interest in the plumbers' registration movement and in all matters connected with plumbers' work. He was only expressing the sentiments of the whole deputation in saying that they felt amply repaid for their visit to the Highgate Museum, which was of a thoroughly practical character and should be visited by all persons in any way concerned in sanitary work. Referring to the spread of the plumbers' registration movement in the provinces, he said that, as an architect, he felt that the Plumbers' Company could not possibly better promote the interests of the public health than by carrying on that movement in the way they were doing.

The members of the deputation, after partaking of some light refreshment, were shown over the Mansion House.

NEW CATALOGUES.

A MONSTER catalogue has been issued by the Ruabon Brick and Tile Company, Limited, containing 100 plates illustrating their specialties. The catalogue has been prepared to meet a requirement believed to exist in the offices of architects and others, and the compilers claim that it is the largest and most comprehensive work of the kind yet published. The aim in view has been to design artistic patterns applicable to modern construction and modern tastes. The company are indebted to a well-known architect, Mr. Alfred Burr, F.R.I.B.A., for his assistance in the preparation of the catalogue. Moulded bricks of all kinds and for all purposes are illustrated, and other ornamental bricks, dentils, bands, jambs, stops, key-blocks, diapers, squares, panelling, diagonals, &c. There are also shown swags and panels, cornices, balusters and balustrading, arches, lintels, architraves, sills, quoins, &c., &c., and every variety of ornamental feature connected with architectural construction.

FUNCTIONS OF THE BUILDER.*

THERE are apparently changes impending which may modify, if they do not transform, the office of the builder. On all sides we find people who are eager to introduce new arrangements. The system by which Great Britain is covered with buildings that are sound, commodious and economical is, in the opinion of amateurs, out of joint, and wants mending. Hence it is we find good-natured people are eager to benefit the world by substituting for our experience the undisciplined boldness of outsiders.

This spirit reveals itself not only in the dreams of imaginative gentlemen who would desire to see the architect leading a body of craftsmen, while in some way he shares in their toil. It is seen, too, in the desire to have architects whose diplomas are evidence that they have mastered all the mysteries of construction, and are able to take our places. It inspires also the proposals of public bodies to dispense with builders. It gives point to the articles which the journals print whenever an

accident occurs. The support which is given to strikes depends on the belief that we are in some way in the wrong. It is a curious fact, as exemplifying this tendency of the present, that the member who was charged with the introduction of the last Registration Bill in Parliament imagined it was intended to apply to builders as well as to architects.

It is not in England alone that there is a wish to disturb arrangements which exist, because they are found to be in correspondence with the needs of the public. I have been told that a few weeks ago in Paris the Chief Administrator of the Department of Public Works declared in public that it was a wrong to have a division between architects, engineers, contractors and workmen, and that all their duties could well be fulfilled by one individual. In England we often hear similar propositions about rolling four single gentlemen into one, but in France the State out of the taxes creates both architects and engineers. Such amalgamation as was suggested on that occasion is equivalent to saying that the Government have been acting wrongly, and that the public funds are misapplied. Yet such is the courage of the advocates of change, they will incur any sort of risk if it helps to advance their hobby.

I am not concerned with a defence of the French system of executing works. But I would ask, what evidence is there that English builders are not performing their work most satisfactorily? In spite of the extraordinary variations of our climate how many buildings are cast down? Even among the defects of jerry-building want of stability is not included. Indeed some artists lament the enduring powers of that class of structure. I am not disposed to maintain that builders are not fallible like the rest of humanity, but I do say that there is no business in the country which, taken as a whole, is conducted more honestly than our own. Nor should it be forgotten that in many cases the temptations to the contrary are very strong.

The proposal to erect dwellings and buildings in London by the County Council without the intervention of a contractor may be taken as an illustration of the lengths to which reformers or rather theorists are prepared to go. In an experiment of that kind everything works smoothly, for there is no risk. The defects in foundations or other natural obstacles need excite no alarm, for the cost of dealing with them is provided for. It will not be necessary to be alarmed about extra works or grieve over the deduction of items which were expected to be profitable. There is no anxiety about the chance of loss or any other contingency of the kind. The men employed will be always in good humour, and those who supply

materials will always be in the most accommodating mood. Building in fairyland could hardly be more of a pastime than it will be under the County Council in London. But can you imagine, gentlemen, that so happy-go-lucky a method can be economical? We who have to suffer mental distress every day on account of the responsibility which we have assumed and who occasionally have to bring all our courage to bear, in order to face our risks, know too well what the consequence will be. No doubt a very pleasant sight will be afforded when we find all who co-operate in a building working harmoniously together, but like all spectacles which are novel it will be found that money must be liberally expended on the arrangements. It will be said by the advocates of similar schemes that on private works in many places the builder has been already superseded. Drapers, co-operative stores and providers of miscellaneous things are credited with having carried out important works very successfully at a fraction of the legitimate charges. All those cases have never been properly scrutinised. If, for example, a co-operative store is able to furnish gasfittings at one-fifth the price which experts had estimated, is it not plain that the profit and loss account of the gas-lighting department of the store was never properly made out? In all such cases a great number of departments have to be taken together, and the loss in one of them is compensated by the gain in another. Then, again, when we hear that a draper has offered to do certain works in stone or iron far below cost price, we may always expect to find that he is to be allowed to supply goods that are within his province. For what he loses in construction he is able to refund himself by what he gains in furnishing. It would be easy to explain many other inconsistencies, but I need not waste your time about them. The public may rest assured that in building works, no matter what agency they may employ they will not gain more than if they had trusted themselves to a respectable and established builder.

We have no opportunities of performing such tricks of legerdemain. If by any oversight we under-estimate the cost of work we have to bear the penalty. We have no means of finding compensation. We have no prospect of receiving payment for work which was not executed. In fact, I consider that if the advocates of revolutionary changes were aware of the liabilities of builders to incur loss, they would be somewhat less bold in bringing forward their schemes.

They are to be excused, however, for workmen who sometimes have been closely connected with us for many years appear to have a notion that all contracts are profitable. In no

other way can I explain the tendency to strikes which has prevailed of late. Any cause seems to be sufficient to stop works. I will give the English workman the credit of being very honest. If he had not assured himself that there was more than sufficient profit in every case to meet his demand, he would hesitate before he created so much confusion. Of late years his demands have taken two forms, an increase of wages and a reduction of working hours. To discuss on what principles wages should be determined would take me too far on the present occasion. It is a vast subject, and one which has many sides. But I think I may say that the workmen of any district (Cardiff among others) would find in our association as reasonable advisers in their difficulties as they could select. The Council of the Association are bound to take a broad view of the organisation of which workmen form an important part, and they are not likely to undervalue anything which would cause business to be stopped for a day if in an honourable way they could devise a remedy. I am sure that I am only expressing your minds when I say we have all the fullest sympathy with our workmen. This is seen by the endeavours which are made to keep them with us. We are all proud of having workmen who have continued with us since their apprenticeship, and I have no hesitation in saying, incredulous as it may appear to sceptics, that one of the causes which lead so many of us into unprofitable contracts is the desire to retain an unbroken staff around us.

As regards working-hours the question must be judged from another point of view. No doubt, gentlemen, your experience has been the same as my own, which is that in no department of life, outside the Government service, a man has not been able to advance himself who has been satisfied with working eight hours a day. All professional men must undergo greater toil unless they wish to remain at a low level. I am afraid our own business would hardly be profitable any day if we were satisfied with giving only eight hours' attention to it. I see no reason, in spite of all my regard for the working-classes, why they should have a much easier life than our own. As a rule, they have not only to work fewer hours, but they are free from responsibilities and other harassing sorts of wear and tear, which we must endure.

Some of you may remember in your youth to have seen statements or tables which were prepared by Peter Nicholson, who once upon a time was accepted as an authority. He called them "Constants of Labour," and they were intended to show how much time was to be occupied with the most insignificant

details of builders' work. I have never used Nicholson's "Constants," nor met a builder who employed them in preparing a tender. But I have no hesitation in saying that the time which he assumed as a basis for his calculations would not correspond with what is now required. For all kinds of handwork more hours are indispensable than formerly. If the "Constants" were now in use they would have to be altered every year.

Now this is a subject which does not concern us alone. The builder is in reality no more than an agent for the public, and whatever affects him must operate also on those who employed him. Strange to say this undoubted fact is not realised. The public would seem to be indifferent when there are contests between workmen and builders. They appear to consider that the disagreeable affair is entirely circumscribed to the parties who encounter one another. They do not see that what builders are contending for is the public interest. For instance, is there a member among all those I have the privilege of addressing who can recall one case where he was told that he might proceed with deliberation in the erection of a building? The rule, as we all know, is to insist on the utmost expedition. We are bound under penalties not to go beyond a determined day.

Now, if buildings have to be erected as hitherto, *i.e.* without loss of time, is it not plain that with shorter hours and a diminution of the quantity of work produced in each of those hours, it will be necessary to employ far more hands, for which building owners will have to pay? By all means let the public become philanthropists. We are quite willing to keep works open for only a few hours every day, and to employ such a number of men that labour will need no exertion. But in that case they must not grumble at the amount of our tenders, nor go about bemoaning the degeneration of builders.

There are perhaps very few of the public who are not more or less responsible for the condition of affairs which is supposed to make a reform of the building trade a necessity. They may not argue like the French official, the representative of the Minister of Public Works, to whom I referred at the beginning. He would lead the public to imagine that it is possible for a workman, under a proper system of administration, to change places with an architect, engineer, or contractor. But by tolerating experiments like those of the London County Council, by encouraging dealers in cottons and soft goods, pins and needles, to go in for masonry, ironwork and sanitation, and by their unconcern during strikes and trade disputes they are helping to make workmen discontented. For my part, I

believe that the worst sort of grievances to endure are, those which are vague, and I am sure building-workmen at the present time would suffer less if they defined what they want, and endeavoured to discover how it could be realised.

As regards our trade, I suppose there never was a time when there were better facilities and more competence for executing work than there are at present. I am an advocate of the promotion of technical education, but I must say that I still believe the best school for young builders is to be found in builders' workshops. No branch among all the industries of England has been put to severer tests than ours. Styles of architecture change, and whatever is in fashion we are able to realise it with all the spirit of our ancient predecessors; Greek, Gothic, Roman or Dutch buildings are alike to us. New requirements demand novel arrangements of construction, which are carried out as if they were an everyday affair with us. In that way the history of any great building works becomes a sort of key to the industrialism as well as the taste of the age.

The public may not be able to appreciate all that we do at a right value. They cannot tell how much it costs to organise a system which will answer promptly and accurately every sort of demand that can be made upon it. But it is evident that at least one school of architects is able to realise how an ordinary builder's workshop can become an auxiliary to the architect's office or the school of art. Some of you, gentlemen, may have seen the remarkable collection of essays entitled "Architecture: a Profession or an Art?" In the pages we find many things which reveal an altered recognition of the builder's importance. Thus it is stated, "The contractor, the purveyor of labour, is not so far removed from actual building work as we architects, for he has, at all events, to know the nature and quality of materials, and he has generally passed through the workshop and learnt one or more trades and made himself a handicraftsman. It would be an excellent thing if every one who aspired to be an architect did the same, and learnt to do work with his hands as well as with his head." The example of the late Sir Gilbert Scott (a name that can never be mentioned by a builder, and especially myself, without reverence) might be cited as suggesting the value of some experience in a builder's workshop. When he had completed his articles in a London architect's office, he went direct to the offices of Messrs. Peto & Grisswell, to whom he gave his services in return for having the run of their workshop and their London works. There he acquired that practical knowledge which was of such advantage to him during a career which was marked by masterpieces.

WOLSTON'S TORBAY PAINTS.

THE price list just issued shows admirable sample colours of these excellent paints. Attention may be called to the details given in regard to the manufacture of the paints, which show the excellence of the materials employed and excellence of manufacture, besides that the paints are frequently analysed by the Woolwich Government establishment. For decorative purposes the oil-colours in collapsible tubes will be appreciated. In addition to these and to the general paints, there are specially-prepared paints for special purposes, enamel paints for baths, railway signal arm paints, anti-corrosive and anti-fouling ship compositions, salt-water and funnel paints, Torbay yacht's black, &c. The Torbay paints, however, are well known, having been supplied for so many years in all directions, and also to the various Government departments at home, in India, and the Colonies.

THE Architect and Contract Reporter.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Reporter to THE ARCHITECT."

THE DENSMORE.

THE WORLD'S GREATEST TYPEWRITER.

TO ARCHITECTS.—If you have come to the conclusion that the use of a Typewriter for writing your Specifications and Contracts will SAVE YOU TIME AND MONEY, give the DENSMORE a thirty days' trial before purchasing any other.

The Machine may then be returned if not found satisfactory in every respect, and a decided advance in typewriting mechanics.

If you decide to purchase it, we guarantee it free from all mechanical defects, and keep it in order for two years free of any charge.

TWO CARRIAGES, fitted with SOFT and HARD CYLINDERS, which are instantly INTERCHANGEABLE, are furnished with each Machine without extra charge—thus one DENSMORE performs the work of two ordinary machines.

NO LIFTING OF CARRIAGES REQUIRED IN ORDER TO SEE YOUR WORK.

If you require anything in Typewriting Supplies, give us a call and look over our stock. We have seventy-five different grades of Typewriting Papers and a large stock of the best Carbon Papers. Typewriting of all kinds neatly and promptly executed by a corps of skilled operators.

The Densmore Typewriter Co., Ltd.

ELEVENTH ANNUAL
BUILDING EXHIBITION

Of all Industries connected with the
Building Trades,

MARCH 11 to 25, 1893.

"THE ARCHITECT" says of the 1892 Exhibi-
tion:—

"The representatives of all industries connected with the
building trades will be wise to commence at once their pre-
parations for the Exhibition. There cannot be as loud a pre-
liminary flourish about an Exhibition in Islington as there is
always about one of those designated as "International";
but if exhibitors will consider the results of the two classes,
they will discover that in the former they have met men of
business and received orders, while for the privilege of par-
ticipating in the universal shows they have not only lost
large sums, but discovered that the *Millions* and holiday
makers, who constitute the mass of visitors, are not fasci-
nated by the best aids to construction."

JOHN BLACK, Secretary.

ELECTRICAL.

THE Bewdley Town Council have received the report of the Electric Lighting and Water Committee relative to the possibility of utilising the flow of water in the Severn for the purpose of pumping water for the supply of the borough, and for providing the electric light. They asked for power to incur a small expense for making further inquiries, which was acceded to.

THE Salford Town Council have sanctioned an expenditure of 50,000*l.* for installing the electric light in the central part of the borough, the sum of 30,000*l.* not having been found sufficient.

THE tender of Mr. George Jennings, Lambeth, London, S.E., has been accepted for an installation of Jennings & Brewer's electro-mechanical apparatus to indicate and record in the engine-house of pumping-station, Melton, Suffolk, the variations at every inch in the level of the water in the tower tank at the Suffolk County Asylum. Mr. George Hodson, Loughborough, is the engineer.

TRADE NOTES.

THE Birmingham City Council have authorised the execution of various works of paving at an estimated cost of 23,683*l.*

AN order has been received by Messrs. Shand, Mason & Co. to construct a large and powerful steam fire-engine for the Dublin Fire Brigade. It will have a capacity of 750 gallons of water per minute, and will project a 11-16 inch jet to a height of 195 feet.

THE contract for reseating the parish church of Broadclyst in oak, laying new floors and heating the building (Mr. E. H. Harbottle, architect, Exeter), has been secured by Mr. William Dart, of Crediton, whose tender was selected out of about thirty others.

THE importance of providing ready means of fire extinguishing in hospitals and other buildings devoted to the care of the helpless is fully recognised by the Metropolitan Asylums Board, and they have recently purchased from Messrs. Merryweather & Sons, of London, one of their light "Valiant"

'EPHINX' PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1½ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving. "ECLIPSE" PORTLAND CEMENT. Quick setting; test, 8 parts. Standard Testing Sand, 280 lbs. per square inch; 28 days. pattern steam fire-engines for the protection of the Northern Hospital, Winchmore Hill. Amongst other public institutions having steam fire-engines by the same firm may be mentioned Moulsoford Asylum, Berks, the Royal Naval Hospital at Haslar, the Royal Military Hospital at Netley, &c.

THE following valuable testimonial has been received by Messrs. John Gibbs & Son, warming, ventilating and consulting engineers, of Liverpool, from one of their clients:—"The extractor chimney-cowl you sent me last month has proved a splendid success, having completely cured the smoking of the chimney, which had given trouble for years. Please send me another, the same to fit pot 8 inches inside and 9 inches outside; and kindly have the flange fixed higher up so as to leave 12 inches to go inside pot."

CHICAGO EXHIBITION NOTES.

FOR the convenience of visitors to Chicago during the forthcoming exhibition a mammoth hotel is being erected by the World's Fair Co-operative Bureau. The hotel is in blocks, somewhat after the plan of St. Thomas's Hospital, and will contain over six thousand rooms. These rooms will be let at a uniform rate of a dollar a day to those who pay a nominal registration fee beforehand, and thus secure the right of occupancy at any time during the exhibition. The sole representation of the World's Fair Co-operative Bureau in Great Britain has been placed in the hands of the City Press Agency, 1 King's Arms Yard, and 51 Coleman Street, London, E.C.

THE Norwegian Viking ship to be sent to America for exhibition at the World's Fair was launched at Sandefjord on Saturday, the 4th inst., in the presence of an immense crowd of spectators, and amid great enthusiasm.

ONE of the interesting contributions from England to the exhibition is to be a reproduction of what is perhaps the finest example in this country of sixteenth-century decorative wood-carving. This is the famous banqueting-hall at Hatfield House, the Hertfordshire seat of the Marquis of Salisbury, and has been reproduced by Messrs. Hampton & Sons, of Pall Mall East. The minstrel gallery, which occupies one end of the hall, and the screen, which stands at the other end, have

been reproduced with great fidelity. The hall is to be encased in a building of wood painted to look like stone.

BUILDING AND BUILDERS.

THE Airdrie Dean of Guild Court has the plans for the erection of a free public library for the burgh. The building, which will cost between 2,000*l.* and 3,000*l.*, is to be erected on a free site in Anderson Street, and will be situated between the County and Burgh Buildings. Mr. Andrew Carnegie has given 1,000*l.* to the building fund.

PLANS for the proposed new fever hospital for the burgh of Leith at East Pilton have been approved of by the sub-committee of the Public Health Committee of the Leith Town Council.

A REPORT of the Lunatic Asylums Committee recommending the enlargement of Rubery Hill Asylum, at a cost of 25,000*l.*, has been adopted by the Birmingham City Council.

THE Durham Urban Sanitary Authority have definitely decided on building an infectious diseases hospital for the borough.

PLANS and estimates are to be obtained for the extension of the Scarlet Fever Hospital for the Birmingham City Council, so as to provide accommodation for 150 more patients.

BESIDES the site a sum of 17,000*l.* has been given towards the building and endowment of the new infirmary for Southport, the tenders for erecting which were to be submitted for consideration on Thursday, the 9th inst.

THE *Coventry Herald* says:—"The dispute in the Coventry building trade has been settled on terms satisfactory to both masters and workmen. Delegates respectively appointed by the master builders and the operative carpenters and joiners, met and considered the application of the men for an increase of wages and a more favourable interpretation of the rule relating to overtime. The result of the conference was that after April next, the wages of the men will be increased from 7½*d.* to 8*d.* an hour; that no piecework will be allowed; that overtime will not be allowed except in cases of emergency, when it will be paid for at the following rate:—From half-past five o'clock in the evening, and from five o'clock the eight weeks before and eight weeks after Christmas Day up to eight to be paid time and a quarter; and from eight o'clock up to ten o'clock,

and from one o'clock on Saturday afternoon up to ten o'clock in the evening, to be paid time and a half; and from ten o'clock up to the ordinary time of starting work each morning to be paid double the ordinary rate, and that two and a half hours' notice shall be given before a man leaves an employer, or before a master discharges a man, such notice to be given so as to expire at the end of any working day.

PLANS have been prepared by Mr. James Milne, Peterhead, for the proposed new fish market to be constructed at Cormack's Slip.

THE *Oxford Chronicle* says:—During the past week the building abutting on the eastern end of Magdalen Bridge, formerly known as Turrell's Hall, has been in course of demolition. Considerable speculation has been rife as to the intention of the owners in regard to the site. We are enabled to state that Magdalen College, who purchased the property some time since, contemplate erecting a block of buildings which will fittingly harmonise with the surroundings. The primary object is to supply a suitable house for the headmaster of the College School, and accommodation will be provided for a large number of boarders.

AT the meeting of the Dudley Town Council the receipt of a communication from Mr. B. Hingley, M.P., was announced, requesting an interview with the borough surveyor as to the desirability of giving warning to several of the inhabitants living in Griffin Street, Netherton, of the dangerous condition of the houses, brought about by mining operations. The Chairman said a meeting of the Sanitary Committee had been held with regard to the matter, and inasmuch as the borough surveyor considered some of the houses and buildings in a dangerous condition, a resolution had been passed to the effect that he be empowered, under the Town and Police Clauses Act, to warn the inhabitants of these houses to move out of them as soon as possible, and to exercise his power to compel them to do so if necessary. Dr. Messiter said it would involve the closing of about sixty houses. It appeared to him a very anomalous condition of affairs that a property-owner should have his houses destroyed without being able to obtain compensation from the mine-owner, whose mining operations had caused the mischief.

AT the meeting of Cambusnethan School Board a discussion took place as to serious difficulties owing to the discovery of extensive pit workings beneath the site of the proposed new public school at Wishaw. The Board caused a shaft to be

sunk at the spot, with the result that disused workings of a remote date were found to exist. The engineer, Mr. Tait, reported that to make the site secure supporting pillars would have to be built in the workings, and a large quantity of blaise cleared out, and the cost of these operations, together with what had already been done, would probably amount to 800*l.*—an outlay not included in the estimated cost of the school. It was decided to proceed with the underbuilding.

A WRIT has been issued by Messrs. Holloway Bros. against the London School Board for payment of 245*l.* 1*s.* 2*d.* alleged to be due to them for work done under the Repairs Schedule, 1889-90. A claim is also made for costs amounting to 3*l.* 3*s.* if the account shall have been paid within four days from the date of the writ. A formal tender in cash amounting to 100*l.* 18*s.* 10½*d.* had previously been made to Messrs. Holloway Bros. to settle the account, but had been refused.

VARIETIES.

THE Irish Great Southern and Western Railway Company propose to expend 25,000*l.* in providing hotels in the south of Ireland for tourists on the plan adopted in Switzerland.

THE Bishop of Winchester has declared that although the last code of instructions of the Education Department to inspectors throughout the country might destroy some of the feebleness of voluntary schools, it seemed almost impossible to take objection to the proposals. It was the bounden duty of the Department to put all voluntary and Board schools in the highest state of efficiency, and although it seemed rather hard on the Church, after using her buildings and organisations for so many years, to call upon her somewhat summarily to put them in order without any assistance from the public, yet the principle was one which it was impossible to dispute.

IMPORTANT sanitary improvements have been effected in the west, south and surgery wings of St. Bartholomew's Hospital, at an expense of 9,593*l.* The new main drainage works have now been completed. All the old sewers have been broken up and removed, and a system of drainage by means of glazed earthenware pipes, with intercepting chambers and manholes, have been substituted. The entire works were executed in a very satisfactory manner by Messrs. Mowlem & Co., under the direction of Mr. E. B. P'Anson, the surveyor to the hospital, at

WORKS, ROTHERHAM. Estab. 1854.

a cost of 6,397 $\frac{1}{2}$., and the whole section has been working efficiently for the last six months. The works were carried out without in any way stopping the general work of the hospital, though that at times was a matter of no small difficulty.

HER MAJESTY has granted the prayers of the petitioners who asked that Leeds and Sheffield should be raised to the rank and dignity of cities.

A PETITION is to be presented to the Commissioners of Sewers asking that Upper Thames Street should be widened. The improvement has actually been in hand since the year 1858, when about seventy premises were set back at a cost of 91,244 $\frac{1}{2}$ 5s., to which sum the old Metropolitan Board of Works contributed 16,375 $\frac{1}{2}$., leaving 74,869 $\frac{1}{2}$., as the net cost to the ratepayers. Under the present scheme some thirty-five premises will need to be set back.

THE First Commissioner of Works, in reply to a question about the delay in the erection of the new buildings for the South Kensington Museum, stated on Monday that the new buildings involve a very large outlay of money—above 400,000 $\frac{1}{2}$.,—and in view of the many other public buildings in progress, which will cause a great increase to the building vote for the next financial year, the Chancellor of the Exchequer has found himself unable to include any amount for that year for the commencement of the South Kensington extensions.

THE late Duke of Marlborough in his will suggests, but without making it obligatory, that the Duchess may see fit to lay out 3,000 $\frac{1}{2}$ in restoring Bladon Church.

AN inquiry has been held by the Local Government Board into the application by the Preston Corporation for power to borrow 95,000 $\frac{1}{2}$ to improve the borough water-supply, by constructing an additional reservoir of 27,500,000 gallons capacity and a 36-inch iron main. There was no opposition.

WORK has been commenced on the New River Walk improvement for the Leamington Corporation. About 3,500 square yards of land on the old Perkins's gardens site has been purchased to be laid out as a garden and to connect it with the New River Walk on the one hand, and, by means of a light iron bridge across the Leam, with the Pump Room gardens on the other. The cost of the extension will be about 1,000 $\frac{1}{2}$.

THE appeal of the Withington Local Board against the judgment of Mr. Justice Chitty refusing an injunction to restrain the Corporation of Manchester from erecting a smallpox hospital at Withington has been dismissed by the Court of

Appeal. In delivering judgment Lord Justice Lindley said the Local Board had no right under the Act to prevent the erection of the hospital.

AN inquiry has been held at Clitheroe into an application by the Corporation for a provisional order to purchase land for the purposes of a sewerage farm for the borough, and also to borrow over 20,000 $\frac{1}{2}$ to carry out the scheme.

A PROJECT is being warmly supported by the inhabitants at Tenby in favour of constructing a promenade pier and landing stage 1,500 feet long with a concert pavilion. The cost is estimated at 30,000 $\frac{1}{2}$.

THE Barnstaple Urban Sanitary Authority have resolved to apply for a sum of 4,500 $\frac{1}{2}$ for public works and street improvements.

THE Works Committee of the Edinburgh and District Water Trust have resolved to recommend the expenditure of a further sum of 50,000 $\frac{1}{2}$ on the borings at Posso, in consequence of the increased depth to which it has been found necessary to carry the borings down.

THE Darlington Town Council at a meeting held on the 2nd inst. in considering the minutes of the Technical Instruction committee, moved by Councillor Dr. Manson (chairman of the committee), adopted the following recommendations:—That 1,500 $\frac{1}{2}$ be paid to the devisees of the late Mr. Jno. Beaumont Pease for 2,082 superficial yards of land adjoining Northgate on the North Lodge Estate, for the purpose of erecting a technical college, the funds available for the building itself being calculated near 12,000 $\frac{1}{2}$ up to the present. Also that a sub-committee should be appointed to consult with Mr. G. G. Hoskins, F.R.I.B.A. (the architect appointed by the council), as to the provisions required in the building.

A MOST useful and instructive essay, by Mr. W. Santo Crimp, M.Inst.C.E., has just been published by Mr. R. J. Bush, of Fleet Street, under the title of "Sewage Treatment and Sludge Disposal." It is the more valuable, as it brings before the reader the latest experiences of science as applied to sanitation.

IT has been decided to extend operations in connection with the coal boring at the Channel Tunnel works near Dover. The preparations for sinking a working shaft are already well advanced, and additional sheds, &c., have been erected. The shaft is about 50 yards west of the boring. It is stated that the boring during the last few weeks has amply confirmed the

If dimensions are given, we can
raise and lower any Skylight.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards, no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists, Illustrations and Testimonials, write as below. For Continuous and other Lights, Estimates given.

THE "WILMOS."

anticipations of the promoters, of the existence of workable coal seams similar to those on the other side of the Channel.

THE Mexborough Local Board have, it is understood, decided to offer the sum of 10,000*l.* for the local waterworks undertaking.

THE *Aberdeen Free Press* says:—We understand that a movement is in progress among the royal tradesmen in Aberdeen to have a bronze statue of Her Majesty the Queen erected on the site at the corner of George Street formerly occupied by the statue of Her Majesty, now in the Town House vestibule. The consent of Her Majesty has been received, we believe, and the proposal has been very cordially taken up by those concerned.

THE *Leeds Mercury* says:—In connection with the Students' Sketching Club, Leeds School of Art, Dr. Jacob gave on Saturday afternoon an interesting lecture, illustrated with lantern slides, on "Trees in Winter Landscape," to a large number of students.

It is proposed to provide at the Scarborough Harbour an additional area of 1,050 square feet for the purposes of the fish trade, and for the goods trade to enclose a space of 180 square feet to the south-west corner of the goods shed.

THE *Gloucester Chronicle* says:—In regard to the search for an additional water supply for the city, the experimental boring which has been going on for some time near Newent seems to promise most important results for the future of Gloucester in furnishing the supplemental supply which has been sought so long. The chief doubt which has hung over the experiments has arisen from the suspicion that the contiguity of the new red sandstone, though well known as affording splendid water-bearing strata, might result in tapping the sometimes adjoining salt-bearing strata, and thus make the water brackish. The tasting test so far has shown that there is no trace of salt.

In the *Atlantic* for February, the Rev. Julius H. Ward, in an article, "White Mountain Forests in Peril," speaks strongly of the urgent need of stopping the wholesale destruction of these forests before it is too late. The present condition of these forests indicates that the lumbermen are taking yearly about six hundred million feet of rough timber from the White Mountain region and the sources of the Connecticut. Either every valuable tract of timber land has been bought by lumbermen in order to take from it all its valuable spruce timber, or it is held by the original owners, who have signed contracts for the cutting of the timber under certain conditions of stumpage.

THE Boston Harbour Commissioners have decided to instruct Mr. W. H. Wheeler, engineer, to prepare plans and estimates for a new dry dock, to be constructed at a cost of about 5,000*l.*

THE Clontarf Commissioners have confirmed a resolution about obtaining a loan for the erection of a town hall on the site leased from Lord Howth at Whitehall, Clontarf, co Dublin.

A SMALL explanatory pamphlet on the fund started from the surplus of the late Royal Naval Exhibition has been issued, the public having taken such a deep interest in the exhibition.

At the general meeting of the Manchester Society of Architects (Incorporated), Mr. Salomons, president, in the chair, Mr. H. Ross, of Accrington, was elected a Fellow, and Mr. A. J. Murgatroyd an Associate of the Society. A paper was read by Mr. John Slater, B.A., A.R.I.B.A., on "The Buildings of the Ancients," which was illustrated by numerous diagrams, and listened to with much interest. The R.I.B.A. prize drawings were on view in the room.

EMPLOYERS' LIABILITY.

THE principal difference between Mr. Asquith's Employers' Liability Bill and that of which Mr. Matthews had charge during the existence of the late Government is, says the *Times*, that the former abolishes altogether the doctrine of common employment. Mr. Matthews did not go so far as this. Generally speaking, his Bill extended the liability of the employer, so as to make him responsible for the acts of any person in a position of responsibility, even though such person was an ordinary manual labourer; and he also extended it to the subcontractor. Another point of divergence is contained in the section providing against contracting out of the Act. Mr. Asquith's Bill prohibits this *in toto*, whereas Mr. Matthews made an exception in the case of existing funds contributed to by the employers as well as by the employed, such as that started on the London and North-Western Railway at the Crewe works. An important provision of Mr. Matthews's Bill—that getting rid of the doctrine *volenti non fit injuria*—is omitted from the measure now submitted for consideration. By the repeal of the Act of 1880, and the abolition of the doctrine of common employment now proposed, the limit of compensation, which in the scheme of the late Government was put at 250*l.*, would disappear.

FAWKNER, ROGERS & CO.

We beg to inform you that Mr. J. R. FAWKNER, who for the past fourteen years has held a responsible position in the London Works and Offices of Messrs. CROSSLEY BROS., Lim., original makers of the well-known "Otto" Gas Engine, has resigned his position to enter into partnership with Mr. HENRY J. ROGERS, M.I.M.E., under the above style, as Manufacturing Engineers, Electricians, and Founders.

The following are **SPECIALTIES**:—

GAS ENGINES.—Every Machine of Note will be found in our Showrooms. Special Oil for Gas Engines at Wholesale Prices.

ROGERS'S PATENT GAS WORKS.—For either Coal or Oil Distillation, erected for Public Buildings, Mansions, &c.

DAWSON'S LOW-PRESSURE STEAM HEATING.—Sole Agents for same. Absolute immunity from danger.

ELECTRIC LIGHTING & FITTING.—STATTER'S Dynamos, Motors, Fittings, Switches, &c.

PATENT VENTILATING FAN, &c., SHAFTING, PULLEYS, AND CASTINGS OF ALL DESCRIPTIONS.

These magnificent Showrooms are intended as a Depôt where the buyer can find an ample selection of Machinery and accessories.

Works:—**WATFORD.** Offices and Showrooms:—**11 & 12 NEW BRIDGE ST., LONDON, E.C.**

NOTES ON NOVELTIES.

WITH the advent of spring, window-blinds will, no doubt, be in considerable request by many of our readers. We have pleasure, therefore, in calling attention to the firm of Messrs. F. S. Smith & Co., 46 and 48 Clifton Street, E.C., who have a reputation for high-class window-blinds of all descriptions.

Embroidered blinds in all colours and designs are a specialty, and their bright effect in exterior decoration is generally appreciated. Messrs. F. S. Smith & Co. turned out over 8,000 Venetian blinds during last season—a testimony to their merits. One chief excellence consists in the colours being heat-resisting. This is due to the attention paid to the quality of stain and varnish used.

THE DEFIANCE SASH-FASTENER.

THIS is a simple little device which is entitled to be called a sash-fastener. It is strong, simple and cheap, and though opened more readily than the old-fashioned window hasp from inside the room, is an absolute fixture from the outside, and it will prove a general favourite with builders and householders if specified by architects. Mr. John Pollock, of 29 Queen Street, E.C., is the patentee.

STUDENTS' PRELIMINARY EXAMINATION.

Of the candidates who presented themselves at the Preliminary Examination of the Surveyors' Institution, held concurrently in London and Manchester on the 25th and 26th ult., the following satisfied the examiners:—

Messrs. Herbert Adams, Richard Maurice Bell, Harold Edwin Bentley, Thomas Darby Berry, Francis Julian Laurence Birch, Arthur Frederick Brown, Henry Herbert Philip Burgess, John William Clarke, Henry William Cobb, Richard Ernest Cole, Wilfred Lee Cowell, Norris Tynwald Cowin, Keston Nelson Crowther, Francis Herbert Dickson, George Herbert Eastwood, Ernest Sydney Evans, Edward Charles Foster, Arthur Edward Green, Albert Grove, Richard Thomas Grove, Gilbert Lionel Hankey, George John Robertson Harrison, Arthur Musgrave Hawkins, Edgar Wilfred Hooper (passed at head of list), Arthur Frank Howland, Ernest Amphlett Huskinson, Alfred Stuart Little, Algernon Knight Lofts, Leonard William Crandall Lorden, Charles Lovegrove, George Edward Luck, Arthur George Marshall, Stanley Arthur Martin, John Miller, Arthur Richard Morrall, Godfrey Nettlefold, Montague Charles Oldman, Percy William Overell, Arthur James Oxley, Charles Frederick Pearce, Octavius Burroughes Pearse, John Brooke Wood Robinson, Arthur Ernest Rome, Joseph Taylor Rook, Sydney Hubert Shaw, William Shepherd, Arthur Plumbe Smith, Henry Smith, Charles Herbert Southorne, Roland O'Brien Thompson, Lewis Tomlinson, Reginald Seward Truman, William Frederick Wallis, Frank Edward Ward, William White, jun., Llewelyn Irby Steuart Williams and John Wilson.

BROCKLEY TILE AND MOSAIC WORKS.

THE utility of tiles has increased of late by leaps and bounds. Whether it be for adding to the artistic effect of a space difficult of treatment or assisting sanitary science in rendering wholesome and sweet the public urinals and lavatories in our streets, we must admit the help that is found in the bright, cleanly and artistic tiles that are so much used. Wishing to be, as it were, "up to date" in the latest ideas and designs, we sent a representative to visit the galleries and showrooms of Mr. Alfred T. S. Carter, at Brockley Road. Looking at his premises from outside, it was impossible to believe where the vast stock was stored which we afterwards had the advantage of seeing, and even now Mr. Carter finds his premises not large enough for his increasing business, and he has in consequence just taken a

spacious building opposite and is also engaged in altering and turning into a warehouse the premises next his. In walking through the showrooms we were greatly interested in the assortment of beautiful and artistic colours obtained, not the hard unsympathetic blues, reds and greens of seven or eight years ago, but delicate and rich shades of bronzes, blues, ambers and reds. One example with a running pattern of clematis was very happy in effect, and we were told that this was the last new tile that Mr. Carter had just designed. There were numbers suitable for dados and hearths, some thousands of which have just been printed in order to keep pace with the demand for them. We also noticed a new wall-lining in soft cool green, with a conventional spray in the centre. Coming to embossed tiles, a very large assortment of soft peacock blues and browns and ambers was in stock, and many were packed ready to go away for large orders. Some of the latest designs were renderings of pomegranate in different tints. For milk businesses, butchers' shops and, in fact, in any place where coolness and cleanliness are of importance, tiles are an absolute necessity, and when necessary an artistic finish should be considered equally indispensable. Mr. Carter has done the tiling-work for numbers of hotels, public-houses, dairies and other premises, amongst which we may mention the Royal Victoria Hotel, Hastings, the Shakespeare at Woolwich and the Lancashire at Liverpool, nearly all the Mecca cafés so popular in the City, and many others. In one of the showrooms we noticed some large painted tile panels just ready for fixing in a dairy, and the subject, a number of cows in a meadow, was very applicable and pretty in effect. There were numerous examples of mouldings from 1 inch to 3 inches wide for frieze-rails, dado-rails and borders to panels in all tints. One with frieze and moulding combined was a very good combination. As the fashion is to have tile curb fenders, Mr. Carter has studied to get long lengths of these in which there was no trace of warping, usually so prevalent, and with regard to tile-hearths their name was legion. In the encaustic and vitrified store-rooms we saw tons of these much-admired tiles of all sorts, shapes and sizes, of the most beautiful designs in whites, blues and greens, and others in sage green, dark greens and buffs, suitable for the aisles of churches, &c. Here also was a stack of 3-inch blacks and whites of admirable sharpness, uniform thickness and tone just being sent off to North America. Of course, in these days of cheapness one must cater for every class, and Mr. Carter has numerous specimens of second quality of all prices for walls, hearths, &c. In the unglazed department, which

has lately become a most important branch, there were all sizes in blacks, buffs, reds, greys, chocolates and salmons, from 1 inch to 6 inches square. Further on we came to the unpacking and packing rooms. These are full of specimens just received or being despatched. One lot of carefully selected red tiles attracted our notice, when Mr. Carter broke one to show us the grain and texture, which was even and hard throughout, and when struck rang like a bell. It is most difficult to get several batches of even colour, size and sharpness, but from the enormous stock we carefully selected and compared many samples so good that it would be impossible to distinguish one from the other in either of these points. The large building we have before referred to is used almost exclusively for marble and ceramic mosaic, and in order to fully appreciate the beautiful designs and workmanship, we carefully noticed many examples from these in hand and in course of completion. Mr. Carter has a number of trained Italian workmen for this large branch of the business, which is growing daily. One can scarcely go into any new building in the City or West End now without finding marble mosaic extensively used, and we think rightly so, for it is after all a revival of some of the work done by the most enterprising nation the world has ever seen. Among others we may mention an effective design representing the arms of Kent, "The White Horse." This Mr. Carter is going to put down on his own premises. Then there are several large panels intended for the forthcoming Building Trades Exhibition, and a delightful reproduction from Winchester College, which is supposed to be the smallest marble mosaic figure in England. In bins round the walls were a large assortment of differently coloured hexagonal tesserae for ceramic mosaic. These make nice floors, and lay with a close joint. The space at our command will not permit us to further detail the vast assortment of tiles of every shape, size and tint amongst Mr. Carter's stock, but architects would do well to pay a visit to Brockley in order to fully appreciate what we have endeavoured imperfectly to describe, viz. that he claims to keep the largest stock in London, which we should imagine is perfectly true.

THE MANCHESTER SHIP CANAL.

the company to raise additional loan capital not exceeding 2,000,000*l.* for the completion of the undertaking at a rate of interest not exceeding 4½ per cent. per annum. The Corporation of Manchester has also deposited a Bill to authorise the corporation to lend the company any additional sums not exceeding 2,000,000*l.*, and it is also provided that any other municipal corporations may contribute towards such further loan. The Corporations of Salford and Oldham have deposited Bills to authorise them to lend the company any sums not exceeding 1,000,000*l.* and 250,000*l.* respectively.

The total area of land purchased to date is about 4,513 acres, the purchase money for which, including compensation for interference, amounts to 1,133,459*l.*, in settlement of claims amounting to 2,187,020*l.* Applications continue to be made for the purchase of surplus lands, and several plots have been sold by the company for works at various points on the canal. The Corporations of Manchester and Salford are applying to Parliament for power to purchase land belonging to the company for the erection of abattoirs and cattle lairages.

The following is the report of the executive committee on construction of works :—"During the past half-year satisfactory progress has been made with the general works, which are expected to be completed by the end of the year; that portion of the work which was let by tender has been pushed on with much vigour, and there is every reason to believe that the contractors will finish within the time specified. The five deviation railways are now finished. The deviation of the Cheshire Lines Railway between Flixton and Irlam has been passed by the Board of Trade, and goods trains are now being worked over that line. The Board of Trade has also inspected the deviation railway between Glazebrook and Partington, and the junctions of the other deviation railways near Warrington. The works on the Runcorn section have been carried on in a satisfactory manner, and although they could not be commenced as early as the other portions of the canal, in consequence of the necessity of first making provision for the accommodation of the River Weaver traffic, it is anticipated that they will be completed concurrently with the remainder of the works during the present year.

"The floods of last autumn brought down into the canal a very large quantity of cinders, ashes and silt, and have thus augmented the quantity of material to be dealt with by dredging. Two powerful dredgers, which were provided for in the estimate of June last, are now being constructed at the Salford Docks, and will shortly be ready for work. If no

further unforeseen contingency arises, there is no reason to believe that the cost of the works for the completion of the canal as set forth in the estimate of June 1892 will be exceeded."

During the half-year 700,997 tons of traffic were carried over the opened portion of the Ship Canal, and although nearly the whole of the present traffic has to be admitted free of toll the net revenue has covered the working expenses. In addition to the above-mentioned traffic 611,896 tons of dredgings were carried. The quantity of traffic loaded, discharged and trans-shipped at Saltport during the half-year was upwards of 100,000 tons, and consisted of Runcorn (Bridgewater Canals) traffic, materials for the works and Ship Canal traffic, such as timber, salt, sugar, pitch, resin, &c. Two regular lines of steamers are now running between Saltport and London and Glasgow respectively.

The report was approved, as well as the Bill for enabling the company to raise the additional capital.

REGISTRATION OF PLUMBERS.

A DEPUTATION of representatives of the British Institute of Public Health (of which Sir Charles Cameron, M.D., is the president, and Dr. Henry Littlejohn, Edinburgh, the president-elect) and metropolitan medical officers of health, representatives of the metropolitan vestries and boards of works, and others, waited upon the Lord Mayor to request him to afford facilities for holding at the Mansion House a conference of medical and sanitary representatives to discuss the questions of the training and examination of sanitary inspectors and plumbers, and kindred subjects.

Mr. Ernest Hart, chairman of the Parliamentary Bills Committee of the British Medical Association, said that the British Medical Association represented some 16,000 medical men, and he heartily supported the application of the deputation. The Association, in conjunction with other medical and sanitary bodies, had taken a great deal of trouble to persuade the Government to require certificates of competence in the case of sanitary inspectors and other persons engaged in sanitary work. They had been so far successful that it was provided by the Public Health (London) Act, 1891, that sanitary inspectors appointed on and after January 1, 1895, should be required to possess such certificates. This applied to the metropolis only, but it was satisfactory to note that already, some time before the Act would come into operation, there was a distinct and growing

demand for like regulations throughout Great Britain and Ireland. This demand had not been yet complied with; not from want of willingness on the part of the Government, but from pressure of public business.

Professor W. R. Smith, medical officer to the School Board for London, in support of the application, read a letter from Dr. Henry Littlejohn, medical officer of health, Edinburgh, consulting medical officer to the Board of Supervision for Scotland, and president-elect of the British Institute of Public Health, urging the need for the discussion of the important questions of the training and examination of sanitary inspectors, the education and registration of plumbers, the treatment of infectious diseases in this country, &c. Dr. Littlejohn affirmed that a conference on these subjects, held under the presidency of the Lord Mayor, would strengthen the claims of the sanitary authorities of Scotland for a new Public Health Act for Scotland.

Dr. S. R. Lovett, medical officer of health, St. Giles's, and president of the Metropolitan Branch of the Society of Medical Officers of Health, said that as a medical officer of health of many years standing he had great pleasure in supporting the request of the deputation. The Lord Mayor had done so much for the public health in connection with the plumbers' registration movement, that they felt every confidence in asking him to aid the proposed conference.

Mr. H. Mansfield Robinson, LL.D., clerk and solicitor to the Shoreditch Vestry, said that his connection with one of the sanitary authorities of London gave him continual opportunities of witnessing the constant trouble and difficulty caused by the unskilfulness of those who were carrying out the sanitary work of London. It was satisfactory to note that so far as the provinces were concerned we had now a code of sanitary laws which left little to be desired. The important powers thus conferred upon sanitary authorities were most drastic, and had put owners of house property to considerable expense in consequence; much prominence had been given to the great necessity for executive sanitary officials being thoroughly well skilled and trained, so that they might command the respect of builders and others upon whom they had to serve orders and notices. He pointed out that the provisions of the new Public Health Act, which required sanitary inspectors to possess certificates of competency, would do more harm than good unless such certificates were only granted after a proper practical test.

Dr. T. R. Richardson, chairman of the Woolwich Local

Board, said he had been trained as a practical engineer, and, as a member of a sanitary authority, he was being continually brought into contact with sanitary inspectors and their work. He fully endorsed what had been said by the other speakers as to the necessity for sanitary inspectors receiving a thoroughly practical training in the work which they were called upon to inspect.

Dr. Simpson, medical officer of health, Calcutta, said he had watched with great interest the work which the Lord Mayor had done in connection with the promotion of the movement.

The Lord Mayor said that, as master of the Plumbers' Company and as Lord Mayor, he was pleased to welcome the deputation. As there was to be a congress of port sanitary authorities of England and Wales at the Guildhall on February 17, on the subject of the prevention of cholera, he thought that the conference suggested by the deputation should take place at the Mansion House the next day.

The conference was accordingly fixed for the 18th inst.

PRIVATE BILL LEGISLATION.

A PARLIAMENTARY return just issued reveals that in promoting or opposing Private Bills before Parliament from 1886 to 1891, both years inclusive, the City Corporation expended nearly 17,000*l.* The Commissioners of Sewers spent another two and a half thousand, and the London County Council or its predecessor, the Metropolitan Board of Works, 47,000*l.* Thus altogether over 66,000*l.*, or 11,000*l.* a year, is the cost of the present Private Bill system to London. Borough corporations throughout England and Wales have paid in the same time nearly 343,000*l.*; the local authorities in Improvement Act districts have also spent over eleven and a half thousand pounds; and Local Boards throughout the English and Welsh counties, 119,000*l.*, so that altogether in England and Wales, excluding London, not far short of 474,000*l.*, or 79,000*l.* a year, has been spent over Private Bill legislation, with London about 90,000*l.* a year. Scotland paying at the rate of more than 18,000*l.* a year for her much smaller business, is, it will be seen, proportionately much more heavily fined for Private Bill legislation. Ireland's costs for promoting or opposing Private Bills in the same period were only 4,600*l.* a year. There are some expenses of harbour and dock authorities not included in these figures. In addition are infinitely larger sums expended

THE WELL-KNOWN FRIEZE,

ENTITLED

"THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

**A Splendid Example of Colour-Work in Permanent Ink Photo,
BY M. PAUL ALBERT BAUDOIN.**

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

by railway companies, tramway companies, gas and water companies, and canal companies. Their expenses grouped together for the six years exceed two millions, and have, in fact, amounted to nearly 350,000*l.* a year.

WORKS AT RAMSGATE AND DOVER.

At the meeting of the Society of Engineers, on Monday, Mr. W. A. M'Intosh Valon, the president, delivered his inaugural address. He said that the rapid development of the principles of engineering science conducing to the health, wealth and longevity of the human race, could but be gratifying to all, and although the colossal achievements of eminent men for the time astonish the world, the everyday questions of water supply, sanitation, gas supply, the application of electricity, general municipal work, and the education of our young engineers, must hold the field in interest with the general public as with themselves. Mr. Valon devoted a large part of his address to the problem of metropolitan water supply. After discussing various proposals he came to the conclusion that a sufficient quantity of water would be obtained from the district between London and the south coast in a more or less direct line, and the coast east of this line, for the supply of a great part of the metropolis, without injuriously affecting or materially diminishing existing streams. But an efficient supply of meterage would have to be used to check the existing guilty extravagance in the use of water.

Mr. Valon described the new harbour works at Ramsgate and Dover. At Ramsgate he had charge. The work from which most difficulty was apprehended was the construction of the new sea-wall across the inner harbour. It was determined to do this work between the rise and fall of the tide, rather than incur the large expense for damming. It has been carried to a successful issue, notwithstanding the existence of springs of considerable size running out from the cliffs. These were gathered up into glazed pipes, laid in the centre under the foundation of the wall, and allowed to discharge at a low point by gravitation, or pumped when necessary by centrifugal pumps. The foundations, wall and counterforts are solid concrete to Ordnance datum; and from this point the wall is faced with Portland stone removed from the old wall, backed in with concrete and with granite coping 2 feet deep and covering the entire thickness of the new wall. Although this wall cuts off a part of the inner basin, it will, as a matter of fact, provide

greater accommodation for shipping, as part of the work consists of deepening the inner harbour, in order that vessels may berth alongside the whole length of the quay. The rising road is carried on arches. These have the principal part of their foundation on the old Military Road wall. The made piers, foundations and walls to the springing are solid concrete, the arches being turned in brick and cement, with a vertical bond throughout, and worked with ornamental facing to the front of the arches and cement piers, so as to give when complete the appearance of an ornamental brickwork construction. As will be understood, the road is not a level viaduct, but descends at an uniform gradient of 1 in 25, until it reaches the centre of the town fronting the sea. From that point it rises to the east, following the natural conformation of the ground, until the highest part is reached, and to do this it is necessary to remove an hotel with a frontage of 132 feet, which has been acquired for the purpose. The whole work when complete will connect the east and west cliffs by a roadway 2,500 feet long, varying in width from 45 to 70 feet. The improvement also embraces the widening of the lower or level road to the Chatham and Dover Railway, by clearing away the storehouses, Customs House, Harbour Master's house, and all buildings and obstructions which might interrupt the view of the mouth of the harbour and the Downs beyond.

The authorities of the adjoining town of Dover have commenced harbour works of a very extensive kind, which, when complete, will doubtless bring additional trade and prosperity to the town, and also form a very desirable place of shelter to accommodate shipping of the largest class.

Half a century ago a Royal Commission recommended that extensive harbour works should be undertaken. The lines then indicated, after a lapse of forty years, were confirmed by another body appointed to consider the subject. Between those dates no fewer than nine other schemes were put forward. The national harbour then proposed, which was to have been built at the expense of the State, and extended across the entire sea front of Dover, east of the Admiralty Pier, has now given place to a purely commercial undertaking promoted by the Dover Harbour Authority, who obtained the necessary Parliamentary powers readily granted, authorising the Dover Harbour Board to defray the cost by imposing a tax of 1*s.* per head on every passenger embarking or disembarking at the port. Even on the basis of the present revenue, this impost will yield an annual return of at least 16,000*l.*

The work commences with the formation of an inclined root

or approach from the front of the esplanade, a little to the east of the Granville clock-tower, which is to be taken down and rebuilt. This approach consists of thick walls of concrete faced with granite. The roadway and footpath will be protected by an exterior coating of asphalt, the walls resting upon concrete cylinders sunk to the chalk and filled solid. Starting from the sea abutment of this approach, there will be an open iron viaduct, 1,260 feet long, arranged in bays of iron piles 40 feet apart, stiffened at three points laterally by braced piers, so as to give due rigidity to the work. Each of the ordinary bays will rest upon three piles, but the braced piers will have five piles. The level of the deck of the viaduct will be 19 feet above high-water spring tides, so as to lift it above the reach of the sea during the heaviest gales. The viaduct will have a uniform width of 30 feet throughout its entire length, there being two sidepaths, each 6 feet wide, and a central roadway 18 feet wide. It is proposed that the structure shall be carried on three rows of latticed girders, supported by wrought-iron piles securely braced together, the piles being in all cases driven deep into the chalk and filled in with concrete. Along the shore there is a considerable deposit of sand and fine gravel, reaching a depth of 20 feet, and gradually tapering away towards deep water. The piers nearest the shore will penetrate this bed of sand and gravel, and rest in the chalk; while the piers supporting the outer section of the viaduct will be driven into the bare chalk. On the girders a roadway will be formed of corrugated plating $\frac{3}{8}$ -inch thick, rivetted together so as to form a continuous table from one end to the other. The corrugations will be filled in with concrete, and on this paving blocks of jarrah timber will be laid. The footpaths consist of Portland cement concrete laid upon the ironwork, with French asphalt surfaces. Iron is to be used for the mouldings, curves and gutters, and a neat handrail will be erected at each side of the pier. At the three points chosen for the stiffening bays open iron seats will be provided, while in the middle bays there will on each side be a covered screen 100 feet long, capable of affording shelter to a large number of persons. Between these bays the width over all will be 52 feet, the side structures causing no interruption in the promenading space of the pier.

The viaduct will be followed by a solid pier 1,500 feet long, consisting of concrete blocks, ranging from 12 to 20 tons in weight. Above low-water mark these blocks will be faced with granite and in all cases they will be founded on the chalk, excavated to a depth of about 3 feet and levelled off to provide a secure foundation. The top width of this portion of the eastern

arm will be 35 feet, and the bottom width resting in the chalk 45 feet, the whole of the blocks being bonded and joggled together, so that the work will be practically monolithic. It is arranged that the coping level of this pier shall correspond with that of the existing Admiralty Pier, being 10 feet above high water of spring tides the difference between the level of this portion of the work and that of the viaduct being met by an incline having an easy gradient of 1 in 40. On the seaward side there will be a parapet of 10 feet wide—the top forming a promenade 6 feet wide and a shelter parapet, like that on the Admiralty Pier, 3 feet 6 inches in width, supplied with railings, stairways and other necessary adjuncts. Above the granite-faced concrete blocks the work will be solid granite, the end of the arm being finished off by a circular head 55 feet in diameter, on which will stand a lighthouse built of the same substantial material—the blocks of the head being bonded, joggled and cramped together. Along the back of the solid work will be laid a protective apron consisting of two rows of concrete in bags (each weighing 14 tons), which will preserve the chalk foundation from the erosive action of the sea. This east arm of the harbour is to take a south-easterly direction until the curve is reached, when it will tend more to the south, the outer portion being south south-west.

The description given sketches shortly the plan proposed for the first portion of the scheme now in progress. It is intended in the future to extend the present Admiralty Pier a distance of 580 feet, forming, with the head of the East Pier just described, an opening to the new harbour 450 feet in width. This can be modified by carrying on the works further, which will doubtless be done in the way that experience may show to be desirable. The construction of the Admiralty Pier has already occupied thirty years, and cost over a million sterling. As soon as the works afford sufficient shelter within the harbour, the reclamation of a shallow water area five acres in extent, situate in front of the Lord Warden Hotel, will be proceeded with. Hereon two jetties will be constructed, each 400 feet in length and 100 feet wide. They will be furnished with capacious landing-stages, which will enable vessels arriving at the period of low water to discharge their passengers at a low level.

The total quantity of concrete to be used on the works will be 310,000 cubic yards. The granite used will equal 460,000 cubic feet, and the iron for the viaduct will weigh 3,000 tons. Mr. John Jackson has contracted to carry out part of this work, at a cost of 414,000*l.*, and has also undertaken to complete the same within six years. After this there remains

FIBROUS AND FIREPROOF PLASTERING.

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

*Price per case of 8 Tins of 14 lbs. each, net 40*s.*, packing included. Special Terms to Wholesale Buyers and Shippers.*

to be completed the Admiralty Pier extension, the internal jetties, the sea wall and the reclamation of the shallow water area, five acres in extent.

THE DIFFICULTIES OF A FRENCH SURVEYOR.

THE country to which the human race owes the first step towards the establishment of a metrical system in perfect harmony with our universal numerical system is France. From what has been said regarding the provincial systems of Great Britain and Ireland, it will not appear surprising that France should at one time present a similar mass of confused and embarrassing weights and measures. The gradual growth of that country by the successive aggregation of its provinces, by treaty or conquest, from the most fertile and populous districts of Central Europe was highly favourable to the preservation of local peculiarities. Each newly added province usually retained many of its laws, customs and fiscal arrangements. It was often considered a privilege to retain what was bad as well as what was good, and thus each provincial system of weights and measures was scrupulously preserved. Thus it happened that, previously to the Revolution, commercial transactions between remote parts of the kingdom were nearly as embarrassing as with foreign countries.

The views developed by La Condamine (1748) had long rendered the question of uniformity of measures familiar in the scientific circles of France, but in 1791 the proposal of a new system began to be discussed not only among scientific men, but also among some of the people who suffered from the confused state of affairs in the provinces. In the spring of 1788 the matter occupied the serious consideration of the Constituent Assembly. In August of the same year the Constituent Assembly charged the Academy of Sciences with the determination of a system founded in nature and destined to permanently supersede the varied and jarring systems existing throughout the provinces of France. It was also proposed that the new system should be so framed as to render it acceptable to the tastes and applicable to the wants of the other civilised families of mankind. The Academy resolved, therefore, that its divisions should be connected according to the decimal scale, and that the units of surface, capacity and weight should all depend on the unit of length. To determine the absolute magnitude of this unit and to fix on a suitable standard for its comparison became a problem of fundamental importance. The commissioners appointed by the Academy to decide on

this question were Lagrange, Laplace, Borda, Monge and Condorcet. After discussing the relative merits of the invariable length which is known to be required for the exactness of a second's pendulum at any given latitude and of a unit taken from the dimensions of our planet, they decided on preferring the latter, as not involving the heterogeneous element of time, and being also necessarily of a more cosmopolitan character. The ten-millionth part of the arc of meridian comprised between the equator and the pole was therefore selected as the unit of linear measurement. It was assumed that as long as the earth continues in habitable conditions for the human race its dimensions cannot sensibly change, and that, consequently, if the national standards of length should through physical or political causes be lost or injured their true values could always be recovered by a direct re-measurement of the earth, or by a fresh determination of the length of the second's pendulum, the relation between which and the standard of length having been previously determined.

Although it was admitted that an estimate of the standard of length deduced from some previously executed measurements of the earth would be more than sufficiently exact for the ordinary purposes of commerce and the arts, it appeared to the French Academy better, both for the sake of science and for the philosophical character with which the new metrical system was to be invested, to make an entirely fresh re-measurement. The management of so important an undertaking was entrusted to a commission of the French Academy, of which Delambre and Mechain were the two astronomers more especially engaged in the geodesical operations. The arc selected for measurement is that extending between Dunkirk and Barcelona, of which the northern and by far the larger portion, extending from Dunkirk to Rodez, was to be superintended by Delambre, while his colleague undertook the management of the operations connected with the remainder. This unequal division of work arose from the presumed greater difficulty of the Spanish part of the arc, and the circumstance that the French portion had been already twice surveyed by different observers.

It was soon found, however, that the principal difficulties were not to be met with across the Pyrenees, but close to the walls of Paris. Mechain had scarcely commenced his journey towards the south, in the summer of 1792, when he was stopped by bands of armed citizens, and kept for a short time under arrest, until regularly liberated by authority. As he advanced, the obstacles to his progress gradually diminished, and he was

able to commence his labours without any interference. In autumn he had completed the entire measurement of the angles of the several stations distributed across the Pyrenees and the north-east of Spain. The following winter was to be employed in astronomical determinations at the southern extremity of the arc.

Delambre was less successful in France; his first difficulty arose from the want of such prominent and distinct objects as would suffice for marking his stations with precision when observed from distances so great as the intervals between these stations. When the angular distance between two objects, each distant from an observer from twenty to thirty miles, is to be ascertained with the minute accuracy required in a geodesical survey, it is indispensable that these objects should be well defined in outline and clearly visible. Such objects as towers and steeples are well adapted for this purpose, but they are not always so situated as to meet the requirements of the system of triangulation. On this account artificial signals have to be frequently constructed, usually pyramidal structures of wood or stone. By the aid of powerful lamps, night observations are also capable of being made with very satisfactory results. Under the existing circumstances, night signals were attended with manifest danger, and Delambre and his associates appear never to have used them except on one occasion close to Paris, and then, perhaps fortunately for themselves, in a most imperfect manner. Only a few nights before this attempt their attention had been excited by a lurid glow towards the south. This arose from burning houses in the Place du Carrousel, for that happened to be the night of August 10, 1792.

Although furnished with passports and other documents emanating from the Government, the astronomers found themselves stopped by serious difficulties arising from the disturbed condition of society. The construction of signals was sometimes prevented by the people; the observers were frequently placed under armed surveillance by the district authorities. Much embarrassed by these obstacles, Delambre despatched one of his assistants to Paris to obtain fresh passports, which were rendered the more necessary from changes that had taken place in the supreme power. He prudently abstained from presenting himself, as he foresaw that he would be told to postpone his labours to an epoch of greater tranquillity, and that with such a postponement an indefinite period might elapse before the undertaking could be again resumed. In the meanwhile he caused his passports to be *vised* at St. Denis, where he happened to have arrived, and also took the pre-

caution of obtaining a certificate from the district authorities. But these precautions availed little, for in half an hour afterwards the astronomer and his companions were arrested at Epinay. The instruments were regarded with particular suspicion, as perhaps dangerous counter-revolutionary engines; just as, a few centuries before, the same people might have looked upon them as apparatus connected with the mysteries of the black art. Delambre was required to display the instruments on the ground, and to explain their use. As may be readily supposed, not one among such a cultivated audience could understand his explanations. He tried vainly to excite the interest of two surveyors who happened to have got into the crowd, by showing the close affinity between his operations and the labours of their profession. These men would not compromise themselves by saying anything; they dared not oppose themselves to the tone which was now so prevalent among the multitude. After a discussion of three hours, the astronomers were conducted back to St. Denis under armed escort. The open place before the venerable mausoleum of the kings of France was filled with groups of Republican volunteers waiting to be armed before marching to defend the frontier. The prisoners had to pass through this motley crowd; their carriages were explored; a heap of sealed letters addressed to the authorities of the departments in which the geodesical operations were to be carried on were discovered. The letters were speedily opened and publicly read, when they were found to be only circulars, in which the Committee of Public Instruction of the National Assembly recommended the bearers to the good offices of the official personages to whom they were addressed. When the curiosity of the crowd had been satisfied about the letters, they next turned to the instruments. These were quickly displayed upon the open part of the square, and Delambre was once more compelled to attempt a lecture on geodesy under circumstances at once terrible and ludicrous. The day was rapidly waning; the last rays of sunset had long since tinged the summit of the abbey, and objects close to the ground were no longer distinctly visible in the growing dusk of twilight. The first ranks of the numerous audience saw little and heard without understanding; the more remote heard less and saw nothing. Impatient murmurs arose; cries began to be heard suggesting the usual expeditious means employed at the time for cutting short all doubts. The president of the district had the presence of mind to suggest the postponement of further inquiry until the suspicious-looking instruments could be examined

with the advantage of broad daylight, and, affecting a tone of severity, he ordered these and all other articles belonging to the astronomers to be placed under seal. Delambre immediately addressed a letter to the President of the National Assembly entreating some specific measure for the protection of himself and his associates. This was done without delay, so that he was able to emerge after the lapse of three days from a place of concealment where he had been obliged to remain since the adventures which had threatened to so abruptly terminate his scientific career.

For some time after these events natural obstacles alone opposed themselves to the progress of the geodesical operations. During the spring of 1793 fresh difficulties arose from the necessity of constantly procuring new passports, and of exhibiting them almost unceasingly at the demand of every local authority. About this period also, the triangulation having been pushed to the northern extremity of the arc, the observers found themselves close to the scene of war, but by changing a few intended stations they were able to avoid the awkwardness of carrying on their scientific labours in the presence of two hostile armies. The work had now advanced to the south of Paris; and as the triangulation approached the Loire it was found essential to construct on the hill of Chatillon, between Pithiviers and Orleans, a signal of considerable dimensions. As this structure was to serve as a kind of geodesical observatory, it had to be so made as to present not only a wide surface to the autumnal and wintry gales that now began to rage, but also a very conspicuous appearance among surrounding objects. The erection thus became a fruitful source of the most absurd rumours, and had to support, along with the fury of the elements, the equally blind attacks of many a village orator.

Hitherto the obstacles encountered by the little band of scientific observers had been generally such as would naturally arise at any period, and in any country, from the combined influence of popular ignorance with the excitement consequent on a disturbed state of society. But at Chatillon they became acquainted with a fact which for a time put an end to their labours. The Academy of Sciences had been abolished six months previously; but the Commission for Weights and Measures was retained by a special decree. The party now in power was favourable to the metrical system, but had little sympathy with the fundamental operations required for its establishment. A provisional standard of length deduced from former measurements was apparently deemed good enough for

definite adoption. The commissioners of the metrical system received hints that it would be desirable to rapidly terminate their labours, and that some of them would very soon be dispensed from further occupation. Not long afterwards Delambre received an official communication, enclosing a decree ordering his suspension, in company with Lavoisier, Laplace, Coulomb and others on account of their doubtful republicanism.

The suspension of the geodesical operations did not continue much beyond the period at which the power of those who commanded that suspension had passed away with themselves; and in the spring of 1794 arrangements were made for resuming the work nearly on the same footing as before. In the meantime, Mechain had not only to contend with physical obstacles among the Pyrenees, but also with difficulties arising from the war which had broken out with Spain. The signals marking his stations were frequently destroyed, the instruments, and even the observers, were sometimes imperilled by the fury of those ascending and descending gusts of wind which are so prevalent among the deep gorges of the mountains. The dangers arising from parties of guerillas were fortunately much diminished by the liberality of the Spanish authorities, who for a considerable time invariably granted the utmost freedom of action to the French astronomers. At length it appeared to the general stationed on the frontier that the information acquired by Mechain and his companions respecting the country traversed during the operations might prove prejudicial to the interests of Spain; and accordingly the astronomer was ordered not to quit the country.

In the autumn of 1794 Delambre recommenced his labours in the neighbourhood of the Loire, but his progress was very slow, from the necessity of defraying all expenses with the now greatly depreciated assignats. After an absence of several months from this quarter, in order to execute the tedious and difficult operation of determining with precision the latitude of Dunkirk, he proceeded with the work to the south of Bourges among the central districts of France. Some trouble and much delay arose in this part of the country, owing to the manner in which church steeples, that would have afforded excellent signals, had been stunted of their proportions by revolutionary fanaticism. One representative of the people had boasted, in a letter to the National Assembly, that he had levelled those steeples which so proudly reared themselves above the humble dwellings of the "sans-culottes." Delambre witnessed everywhere that the humble "sans-culottes" regretted very much the loss of their steeples; and on one

occasion, having had to supply a church spire, which his triangulations rendered indispensable, its subsequent removal was prevented by the determined opposition of the entire parish. At another station, having covered with white canvas, to render it distinct, one side of a pyramid of planks which occupied the place of a levelled church spire, an alarm arose among the people at the sight of a colour in their eyes so significant of counter-revolution; but a complete remedy was soon provided, by attaching to one side of the white canvas a strip of red cloth, and to the other side a strip of blue. This signal was always respected, while another, only a few leagues to the south, was in constant danger. The very day on which it was erected a violent storm visited the neighbourhood, and the mountain torrents swept an immense volume of earth and gravel into the streets of the adjacent town, where apprehensions were at the same time entertained for the safety of a bridge across the river Dordogne. The signal was blamed for these disasters, and it had also to bear the imputation of causing the heavy rains which for two months suspended agricultural labours among the mountains. Several attempts were made to cause its removal; but, fortunately, its position was almost inaccessible. All the triangulation of the south having been finished, nothing remained but the measurement of the two bases at Melun and Perpignan. These measurements were terminated without any difficulty except such as are natural in labours requiring so many precautions, and in which the physical observer is compelled to employ every resource that science can bring to his aid.

Invitations had been issued by the French Government to neutral and allied countries, in which they were requested to send deputies to Paris, who should assist, along with the Commissioners of the Academy of Sciences, in the final settlement of a metrical system adapted to the usage of all nations. Such deputies had been accordingly despatched from the Netherlands, Denmark, Spain, Switzerland, and several states of Italy. The entire body of French and foreign commissioners having assembled about the beginning of the year 1798, divided itself into sub-committees.

After long investigation, it appeared that the ten-millionth part of an arc extending from the pole to the equator was 443'3255 lines of the old measure, and a bar of this length was accordingly adopted as the mètre. When the measured arc was afterwards prolonged to Formentera, this value was altered by less than its sixty-thousandth part. The length afterwards

definitively adopted is 443'296 lines; so that the mètre is equivalent to a little more than 39 $\frac{1}{2}$ English inches. The standards of surface and capacity, as may be readily conceived, were deduced from multiples or submultiples of the linear standard. Thus a square 10 mètres long was designated as the standard of surface for land measure; in other words, the value of this unit is 100 square mètres. The standard of capacity for liquids was determined by finding a cylindrical volume equal to a cube whose edges are formed by tenths of the linear standard. This is the litre, a measure somewhat smaller in capacity than one of our imperial quarts.

THE BLACKMAN VENTILATING CO., LTD.

Having acquired an extensive and special experience in handling many thousands of successful installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.
All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

Head Office:—63 FORE STREET, LONDON, E.C. Branches at MANCHESTER, BRADFORD, BRISTOL and GLASGOW.

THE DENSMORE.

THE WORLD'S GREATEST TYPEWRITER.

TO ARCHITECTS.—If you have come to the conclusion that the use of a Typewriter for writing your Specifications and Contracts will SAVE YOU TIME AND MONEY, give the DENSMORE a thirty days' trial before purchasing any other.

The Machine may then be returned if not found satisfactory in every respect, and a decided advance in typewriting mechanics.

If you decide to purchase it, we guarantee it free from all mechanical defects, and keep it in order for two years free of any charge.

TWO CARRIAGES, fitted with SOFT and HARD CYLINDERS, which are instantly INTER-CHANGEABLE, are furnished with each Machine without extra charge—thus one DENSMORE performs the work of two ordinary machines.

NO LIFTING OF CARRIAGES REQUIRED IN ORDER TO SEE YOUR WORK.

If you require anything in Typewriting Supplies, give us a call and look over our stock. We have seventy-five different grades of Typewriting Papers and a large stock of the best Carbon Papers. Typewriting of all kinds neatly and promptly executed by a corps of skilled operators.

The Densmore Typewriter Co., Ltd.

HARDAKER, Electrographer, 21 Cursitor Street, E.C.

ROYAL AGRICULTURAL HALL, LONDON.

ELEVENTH ANNUAL BUILDING EXHIBITION

Of all Industries connected with the Building Trades,

MARCH 11 to 25, 1893.

"THE ARCHITECT" says of the 1892 Exhibition:—

The representatives of all industries connected with the building trades will be wise to commence at once their preparations for the Exhibition. There cannot be as loud a preliminary flourish about an Exhibition in Islington as there is always about one of those designated as "international"; but if exhibitors will consider the results of the two classes, they will discover that in the former they have met men of business and received orders, while for the privilege of participating in the universal shows they have not only lost large sums, but discovered that the dilettanti and holiday makers, who constitute the mass of visitors, are not fascinated by the best aids to construction.

JOHN BLACK, Secretary.

Exhibition Offices: 2 Newcastle Street, Strand.

VARIETIES.

THE Hull Dock Company have, at an extraordinary general meeting, unanimously resolved to agree to the proposed sale of the Hull Docks Estate to the North-Eastern Railway Company for 3,000,000.

THE ground and steps and the approach at the west end of the parish church, Kettering, are now under renovation, and when these works are accomplished, and the new organ erected, the restoration will be practically complete.

THE borough surveyor of Rhyl, Mr. Robert Hughes, has made an examination, in company with Mr. W. Shone, of Chester, of the submerged forest on the shore at Rhyl, and has come to the conclusion that the discovery is really the remains of an ancient forest extending back probably several centuries.

THE Local Government Board have sanctioned the loan of 2,000*l.* for the purpose of carrying out the sewage scheme at Henley-in-Arden.

AT the weekly meeting of the Mersey Docks and Harbour Board the Marine Committee recommended the filling up of

the embayment in the Liverpool ferry goods stage, at an estimated cost of 9,000*l.*, which was agreed to.

THE Inman Line will shortly take up its headquarters at Southampton. Messrs. Lucas & Aird are pushing forward the new graving dock they are constructing for the South-Western Company, at a cost of over a quarter of a million. More than four hundred men are at work, and over six thousand yards of chalk are being daily utilised in building the embankment. The work will probably take three years to complete, and will then be the largest graving dock in the world.

IN the open competition for designs for laying out eleven acres of the Fields Estate, Newport, Mon., for building purposes, eight sets of plans were received. Messrs. Veall & Sant, architects, Cardiff, the professional assessors, awarded a premium of 25*l.* to the design marked "Fairfield C," the author of which is Mr. Alfred Swash, architect, Newport.

THE annual dinner of the Cardiff Architects' Society was held in the Park Hotel, Cardiff, Mr. Vaughan in the chair, and supported by a large and representative professional gathering including Messrs. Forster Browne, F. Thompson, E. W. M. Corbett, E. H. Bruton, George Thomas, J. Coates Carter (hon. sec.), H. Snell, A. Swash, E. H. Fawcner, Grocock, Moses, Wilson, Rooney, D. Morgan, E. J. Williams, and Cornish. The loyal toasts having been duly honoured, Mr. Forster Browne proposed "The Art of Architecture."

THE *Reading Mercury* says:—The Berks Archæological and Architectural Society's Quarterly Journal (which can now look back on four years of existence), continues in its January number the selections from early Berkshire wills, and also its account of "Swallowfield and its Owners," from the pen of Lady Russell. Mr. Nathaniel Hone gives a translation of a curious "Inquisition 'de probatione ætatis'" or "proof of age" in the case of Elizabeth, daughter and heiress of John de Shottesbrok, 1296-97, the evidence of "twelve lawful men and true" being taken to prove that she is of lawful age to come into her property.

AT the meeting of the Hyde (Lancashire) Town Council, the Town Clerk reported that sanction to a loan of 10,000*l.* for the purpose of constructing a cemetery had been granted.

AT the meeting of the Shrewsbury Town Council it was reported that the Local Government Board had sanctioned the borrowing of 7,000*l.* for the erection of a police station.

THE annual dinner of the Clerks of Works Association of Great Britain, of which Mr. J. Oldrid Scott is hon. treasurer,

took place on Monday, the 13th inst., at the Holborn Restaurant. Mr. J. Blashill, architect, presided, Mr. H. O. Cresswell, president of the Architectural Association, being present among others. After the usual toasts that of the Clerks of Works Association was duly honoured and responded to by Mr. W. R. Cubitt, president. Responding for the Carpenters' Company, Mr. Banister Fletcher gave a description of the efforts of the company to promote technical education, speaking especially of the work of the company in conjunction with University College, the Council of King's College, the Society of Wood Carving—in connection with which they have established trade and amateur schools—and the Corporation of West Ham.

ELECTRICAL.

THE London County Council have adopted a recommendation of their Parliamentary Committee, and agreed that 5,000*l.* extra expenditure be authorised in the Bill which provides for lighting the Victoria Embankment and Gardens and Westminster and Waterloo Bridges.

At the meeting of the Dewsbury Town Council a discussion took place in respect to a recommendation of the Gas and Lighting Committee to adopt the site of the old gasworks for a central station for electric lighting. Another site was mentioned, near Webster Hill, but ultimately the recommendation of the committee was adopted.

BUILDING AND BUILDERS.

At Prestonpans a public meeting of ratepayers, called by the Chief Magistrate, has just been held to consider an offer by the local Institute Committee of nearly 1,000*l.* and a free site for the erection of a town hall. A plebiscite of the ratepayers will be taken forthwith.

THE *Scotsman* says:—The briskness in the building trade in Glasgow shows no sign of abatement. At a sitting at the Dean of Guild Court yesterday eleven "linings" were granted for the erection or alteration of property in the city. Mrs. Ferguson, Inverleith Row, Edinburgh, received the necessary permission to alter and add to property at 7 Ferguson Street, and Paterson's Chemical Manufacturing Company, Limited, to add to their works at Lochburn.

TENDERS are being taken in for building the Castle Street entrance to Tullie House, Carlisle, according to revised plans.

At the annual meeting of the Victoria Dental Hospital, Manchester, held in the Town Hall, Dr. Ward, principal of Owens College, made an earnest appeal for funds for the erection and equipment of a new building. A sum of 10,000*l.* is needed.

AN inquiry has been held by Mr. Arnold Taylor on behalf of the Local Government Board into the application of the Croydon County Council for permission to borrow 20,000*l.* for various purposes connected with the proposed new municipal buildings. When the plans were prepared, it was estimated that the structure would cost 70,000*l.*, and it became necessary to apply for another 35,000*l.* Since the estimate was made, however, it had been ascertained that the building would really cost 78,374*l.* A part of the excess could be accounted for by the cost of electric wiring, heating, &c. The inspector remarked that the custom of estimating the cost of a building per cubical foot, which was so much in vogue, was a very untrustworthy one.

SKETCH plans by Mr. Simpson, architect, of the infectious diseases hospital proposed to be erected for the burgh of Leith, having been generally approved by the sub-committee of the Town Council, are now being exhibited in the Council Chamber. The estimate of the cost of the construction of the hospital, according to the plans, is as follows:—Wards, mortuary, stable, lodge, administrative block, washing-house, laundry, disinfecting-house, discharging block and other buildings, 17,993*l.* 18*s.* 1*d.*, but adding for contingencies at 7½ per cent., 1,349*l.* 10*s.* 10*d.*, the cost is brought to 19,343*l.* 8*s.* 11*d.*; enclosure and other walls, fences, gates, covered ways, ambulance drive, &c., 1,676*l.* 17*s.* 2*d.*; furnishings, &c., 3,300*l.* 0*s.* 6*d.*; and contingencies at 7½ per cent., 373*l.* 5*s.* 3*d.*—making the total estimated cost 24,693*l.* 11*s.* 4*d.* This estimate is exclusive of the cost of a main sewer and laying out the grounds.

It is proposed to make a start during the coming spring with the new church of St. Mary's, for Kettering, the funds for which have been given by an anonymous donor. Plans and specifications have been agreed to.

A PARSONAGE-HOUSE is to be erected in connection with St. Peter's parish, Farnworth, near Bolton, at an outlay of 1,335*l.*

situated No. 34 Dover Street, Piccadilly, and having a frontage to Berkeley Street, has been purchased by the Baths Club, Limited, a company of which Mr. Herbert Gladstone is the chairman. The object of the purchasers is to erect a clubhouse, which, besides being an ordinary social and residential club, will also combine the advantages of hot and cold baths, a large swimming bath, Russian and other vapour baths, and one of the finest Turkish baths in the metropolis. The architects are Messrs. Young & Spence, of 17 Coleman Street, E.C., and Mr. E. H. Bouchier, F.R.I.B.A., of 32 St. George's Street, Westminster, acting as consulting architect.

THE death of Mr. G. H. Cox, the architect for the Aston Technical School, together with the failure of the builder, has placed the Aston Technical School Committee in a dilemma. A meeting was convened, at which the present state of affairs was discussed, and it was decided to enter into an agreement with the guarantors for the completion of the building, the Building Committee being authorised to appoint another architect to superintend the work.

PLANS for the construction of the new post office and inland revenue office at Nottingham on the site in Queen Street, recently purchased, have now been completed by Mr. Henry Tanner, architect to the Post Office, and Mr. Leverton, surveyor to the Board of Works. The total cost is not to exceed 50,000/.

The nave of Swansea parish church is to be rebuilt at an outlay of 10,000/., against which the sum of 3,500/., has been promised by local subscribers.

THE Leeds School Board have decided to enlarge the Rodley School. The mixed school will in future be used as an infant school, with accommodation for 168, and the present infant school, to which three new classrooms will be added, will be used as a mixed school, with accommodation for 240, or a total of 408.

THE Lunatic Asylum Committee of the Middlesbrough Corporation have recommended the Corporation to accept Mr. J. S. Pennyman's offer of a site of about 76 acres, at 100/., per acre, at White House Farm, North Ormesby, for the erection of a new asylum for Middlesbrough.

THE Mayor of Hull gave a luncheon to the deputation to inquire into the principle of erecting workmen's dwellings in Hull, the Leeds back-to-back system not prevailing in the structure of houses for the working-classes in the port. After luncheon the party proceeded in conveyances to various parts

of the town, and the fullest information was given to the visitors on the subject matter of their inquiry.

TRADE NOTES.

At the annual meeting of the Association of Master Painters in Scotland held in the Royal Hotel, Edinburgh, the gathering was a large and representative one. Mr. John White, Aberdeen, retiring president of the Association, occupied the chair. From the report of the committee, it appeared that the Association was in a flourishing condition. The report also stated that harmony existed between the employers and employed, with the exception of the case of Greenock, where there was a strike in consequence of a proposal by the masters to reduce the standard rate of wages. Mr. Macfarlane, the president elect, in the course of an address controverted the recent statement made by Sir George Reid that "the Lowland Scot is utterly destitute of artistic feeling, but wherever the Celtic element comes in there you get art, eloquence and music."

THE authorities of the Regent Street Polytechnic, London, have hit upon an ingenious plan with a view to mitigating the difficulty experienced in choosing a type-writer. A series of lectures has been arranged where each type-writing instrument is explained by an expert. The third of the course was delivered by Mr. Herbert Langford, who adduced much evidence in support of his claims that the ink pad, the centre guide and the pointer of the "Yost" were unique and effective improvements.

THE preservation of human life should be the first study of all who have control of our streets and the construction of our buildings; therefore it more especially devolves on architects, engineers and others to gain all the knowledge they can of the most effective materials in the market which will further this end, as it must be borne in mind that, however skilful an architect or engineer may be, if his specification is carried out with inferior material all his labour is lost. Few people at any time think of the great number of accidents occurring daily on the stairs of public buildings, warehouses, workshops, in passages, on coal-plates, and the thousand and one covers which dot our footpaths, through these being worn and slippery. Were they to study these statistics for one moment they would be shocked at the number of such accidents, in some instances injury for life being the result, and in others the loss of life

RENDLE'S PATENT GLAZING.

NO PUTTY OR CEMENT USED.

NO EXTERNAL PAINTING.

USED BY H.M. GOVERNMENT FOR THE LAST 12 YEARS,
AND SPECIFIED GENERALLY WHERE FIRST-CLASS WORK IS REQUIRED.

Illustrated Catalogue can be obtained post free from the Inventors and Patentees,

WM. EDGCUMBE RENDLE & CO.,

Westminster Chambers, 5 Victoria Street, London, S.W.

itself. For many years those whose business it is to study this matter have been looking for something which should be effective, and yet not costly. This has at last been found in Mason's Patent Treads, which is proved by the readiness with which it has been adopted by the various Government offices, School-Boards, Bank of England, Civil Service Supply Association, Army and Navy Supply Stores, the various railway companies, Local Boards, Corporations, &c., where the enormous traffic necessitates the constant attention of the officials to this matter. From our knowledge of this patent we are not surprised that in order to fully develop the various uses to which it can be applied it has been found necessary to form a company, under the title of the Safety Tread Syndicate, Limited, with offices at 15 Barbican, E.C., an abridged prospectus of which appeared in our last week's issue.

THE execution of the design furnished by Mr. J. L. Pearson for the John Couch Adams memorial, to be placed in Truro Cathedral, has been entrusted to Mr. Juleff, of Grampound Road.

THE new drainage works just completed at St. Bartholomew's Hospital, which were executed under the superintendence of Mr. E. B. P'Anson, the surveyor to the hospital, particulars of which we gave in our last week's issue, were ventilated on the "Climax" Ventilating Co.'s system, their patent direct-acting soil-pipe extracting and patent three-sided mica valve inlet ventilators being used throughout, the same being supplied by the "Climax" Ventilating Co., Limited, of 15 Great George Street, Westminster, and 93 Hope Street, Glasgow.

AT Christchurch, Cairo, memorials have just been placed of Major-General Sir Herbert Stewart, K.C.B., who died at Jakdul of wounds received at the battle of Abu-Kru, when in command of the desert column in the Nile Expedition for the relief of Khartoum. These consist of a handsome polished-brass altar-rail, with telescopic centre and an inscription brass. The designs were prepared and the work executed by Messrs. Thomas Pratt & Sons, memorial art workers, Tavistock Street, Covent Garden, who had previously supplied for the same church the memorial-brasses to Lieutenant-General Valentine Baker Pasha, his wife and daughter.

IN the new play, "Becket," the archbishop's robes worn by Mr. Irving and those of the bishops, both English and French, were made by Messrs. Thomas Pratt & Sons, Tavistock Street, Covent Garden.

THE new schools, Great Ayton, are being warmed and

ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

THE new Harris Free Library and Museum, Preston, is now almost completed, and we understand it is intended to open the building this summer. The pavements have just been completed, and there is a marked consistency of treatment throughout the whole. The grand staircase and central hall on the ground floor are laid with a pleasing combination of rouge giotte, dove, black, vert-antique and white-veined marbles, with Hopton wood stone; the central ornament being in the form of a radiating star, which, seen from the gallery, is exceedingly effective. The pavements of the principal and upper floors are in Roman mosaic, the borders chiefly in black and white marbles arranged in strictly classical patterns, and the centre a mixture of rouge verona and Carrara marbles. Mr. James Hibbert, of Preston, is the architect, and the work has been carried out from his designs by Messrs. J. & H. Patteson, Oxford Street, Manchester.

A NEW turret-clock, showing the time upon one external copper dial 5 feet in diameter, has been placed in Catterick Church, North Yorkshire. Messrs. Poth & Sons, Leeds, are the makers. They are also making a new clock for Mr. Yeomans, for Osmotherley Church, and clocks for the parish church, Hartlepool; West Rainton Church; North Stockton Railway Station, Durham; Richmond Town Hall, Surrey; and Colne Town Hall, Lancashire; Cambridge, Northampton, Oldham, Bradford and other important places.

THE Middlesex County Council are entitled to credit for the practical step they have taken in establishing a class on plumbers' work in connection with the Museum of Sanitary Appliances and Testing Department belonging to the Hornsey Local Board at Highgate. The Council have appointed Mr. George Taylor, registered foreman plumber, as teacher, and have made it conditional that the teaching shall be alternately technical and practical, and that the class shall be open to those actually engaged in the plumbing trade, either as apprentices or otherwise. The merely nominal fee of 2s. 6d. for the course is made, and this will be returned to those students who make 75 per cent. of the possible number of attendances.

THE Local Board of Clacton-on-Sea have accepted a tender from Messrs. B. Cooke & Co., of Battersea, London, S.W., for the construction of sewers and sewage outfalls for the district of Great Clacton. The accepted tender is 10,374/. The works

are to proceed immediately. Mr. W. H. Radford, C.E., of Nottingham, is the engineer to the scheme.

THE Local Board of Caversham have instructed Mr. W. H. Radford, C.E., of Nottingham, to prepare a scheme for the sewerage and sewage disposal of their district.

CHICAGO EXHIBITION NOTES.

MESSRS. JEFFREY & CO. will exhibit at the Chicago World's Fair specimens of their manufactures of all classes of wall-papers, representing the highest class of embossed leather papers finished by hand, flocks and various examples of hand-printed papers and friezes and machine-printed papers. The decoration facing the chief entrance of the exhibit is the "Trio" designed by Mr. Walter Crane, which comprises a most effective frieze of singing birds, in which he has made a new departure by the use of a pilaster, into the panels of which are introduced child-figures, representing Music, Painting, and Poetry, while underneath lies the open book on which is inscribed—

Life's house to deck come Graces three,
Music, Painting, Poesy.

This is shown in two renderings, viz. in blue and yellow and also in red and yellow. Another new design, by Mr. Lewis F. Day, the "Piccolomini," is a large scale pattern of conventional foliage and flowers. It is worked in tones of olive and blues on a pale ground, giving all the richness of a silk; and secondly, in a scheme of red, orange and russets. The "Vine" pattern, by Mr. Heywood Sumner, has great freshness as to decorative treatment. The vine springs from a base, with an upper terminal forming almost a pilaster in itself, and yet can be used as the entire covering for a wall or in combination with a diaper. It is printed in gold on a white satin ground, the gilding being tinted with a delicate green or yellow. The examples of the embossed leather papers, which have all the appearance of antique leathers are "The Peacock Garden" and "Golden Age," by Mr. Walter Crane, the "Florentine," by Mr. L. F. Day, while printing in lacquers, is shown to great advantage in Mr. Walter Crane's "Corona Vite." Mr. H. W. Batley's "Buckingham" in flocks; Mr. W. J. Muckley's frieze of "Naturalistic Roses"; Mr. S. Mawson's green and gold decoration; and Mr. C. F. Voysey's frieze, filling and dado are each fine specimens of paper-staining in its various branches.

By direction of the German Emperor a model of the new

Reichstag building, on the scale of one-twentyfifth, will be sent to the World's Fair. The model is $5\frac{1}{2}$ metres long, $4\frac{1}{2}$ deep, and 3 metres high, and has cost nearly a thousand pounds.

THE British section of the Chicago exhibition will, in the women's department, include a representation of English literature, old and new, and for this a literary sub-committee has for some time been preparing. Among the manuscripts is an illustrated unfinished copy of "The Boke of St. Albans," from the pen of Dame Julia Berners, abbess of an old convent in Hertfordshire. Modern English literature is represented by about one hundred works of fiction, and by books of poetry, science, biography, travels, &c.

THE "exhibit" of the School Board for London, prepared under direction of Mr. John Lobb, chairman of store sub-committee, for the Chicago Exhibition, was on view in the Board Offices, Victoria Embankment, on Wednesday, the 15th. It was made up almost entirely of "hand and eye" work executed in the schools by children of all ages from four to fifteen, and included specimens of Kindergarten work of all kinds, needlework, laundry-work, writing, maps, freehand, model and technical drawings, shading from the cast, designing with colours, designing with coloured papers, modelling in cardboard and clay, woodwork, ironwork, and brass and copper work.

NEW CATALOGUES.

MESSRS. B. WARD & COMPANY, 15 Great George Street, Westminster, S.W., have sent us a catalogue of their patent specialties, describing and illustrating their patent granite concrete stable paving (grooved and channelled), their improved and registered system of stable drainage, patent concrete paving for all kinds of buildings, also for roadways and footpaths, patent steel webbed fireproof solid concrete floors, patent system of finishing wood floors with concrete, wood block, asphalte, tiles, &c.; patent limestone concrete landings and staircases, artificial stone dressings in red, buff, grey or green, improved granite concrete paving for footpaths, station platforms, &c., works in artificial stone, improved wood-block flooring, improved fibrous plaster slabs, &c. These slabs are a capital substitute for ordinary lathing and coats of plaster at a very slight extra cost, but saving time in fixing and drying and more fire-resisting, and a defence against damp. The wood-block flooring has been designed to secure a floor that is economical in cost in addition to being solid and sub-

Notice.

Buyers should satisfy themselves that Goods offered by other Firms do not infringe Hill's Patent Rights.

JAMES HILL & CO., 100^A Queen Victoria St., London, E.C.

stantial, complex methods of fixing the blocks having been eliminated. They may be had in a variety of woods and also designs. The artificial stone dressings are also executed to architects' own designs, and have some advantages over stone or terra-cotta in regard of cost and durability; also the process of manufacture is not liable to any occasional uncertain results. For staircases the steps are cast separately or formed *in situ*, and the company claim to have had great experience in forming staircases *in situ* and in one solid block, and these are less costly than stone. It is also claimed for them that they are fireproof. The concrete paving serves for innumerable purposes. In houses there are kitchens, sculleries, &c., and then there is the back yard, perhaps stables and stable yard, where the paving is required. There are cattle markets, kennels, piggeries, warehouses, laundries and washhouses, factories, mills, breweries, schools, hospitals, drill sheds; all these are but a few instances of endless places that might be mentioned. The paving for stables, cowhouses and the like appears to have given general satisfaction wherever used. The wear and tear in stables soon shows a mark for good or evil, and therefore a good material and system for stable drainage carries with it its own certificate of utility. A very long list is given of the places where this company has carried out works.

THE "ECLIPSE" PAINT REMOVER.

WE had occasion to refer to the merits of this specialty more than a year ago, and we are glad to notice that our prediction as to its success has been more than realised. It has been largely adopted by railway companies, builders and contractors; in many cases where other paint removers have failed to give satisfaction. The proprietors of the "Eclipse" guarantee its effectiveness, and claim that there is no paint, enamel, varnish on wood, stone or iron it will not rapidly remove. The "Eclipse," moreover, neither injures the surface nor the paint or varnish afterwards used, so that it may safely be recommended for the best class of interior work. The "Eclipse" Concentrated Paint Cleaner, and the "Eclipse" Washing Fluids are for the purpose of removing dirt and grease on wood or metal, being at the same time a powerful disinfectant.

The address of the manufacturers of these specialties is at 1A Crescent, Minories, London, E.C., and fuller particulars will be forwarded on application.

NOTES ON NOVELTIES.

New Telescopic Trestles.—We illustrate a telescopic trestle supplied to the Junior Constitutional Club by Heathman & Co., the patent extension ladder makers of Endell Street,

London. It is 12 feet when closed, and extends up to 22 feet, but can be adjusted at any lesser height, and closes most compactly to stow away and carry about. One person can manage it.

ARTISTIC WALL DECORATION.

THERE can be little doubt that the wall-paper buying public are year by year getting more critical and more exacting in their demands, utterly refusing to be satisfied as of yore with the decorator's small stock of papers. They are now beginning to look askance at even pattern-books, and every decorator

must be weary of the oft-repeated query, "How will it look up?"

Messrs. Percy Heffer & Co., 64 Berners Street, have taken large show-rooms, and expensively decorated them with a view to satisfying the above and like queries. Anyone provided with the decorator's card can see there any number of applied decorations. It would be absolutely impossible to mention their papers in detail; but we were particularly struck by some of their bold decorative friezes, 30 inches deep and 42 inches in repeat, which, while they harmonised to perfection with the fillings yet gave a distinctly fresh decorative effect to a room, while the average frieze is, as a rule, but a tame reproduction of the colours of the filling.

We understand from their representative, who showed us round, that although they were making artistic wall-paper their specialties, their prices ranged from 3d. to 3s., so that no one need expect to find high-class paper outside their price. We strongly advise our readers to inspect these excellent wall-papers, which show that the canons of art are not unknown to the designers.

ELECTRIC LIGHTING OF LAMBETH.

THE Electric Lighting Committee of the Lambeth Vestry have consulted Mr. W. H. Preece, the chief consulting engineer to the Post Office authorities, as to the best mode of carrying out the electric lighting order granted by the Board of Trade to the vestry last year, and subsequently confirmed by Parliament. In his report to the committee Mr. Preece remarks that it has been the fashion to regard the electric light as the lamp of luxury, and strange views are frequently expressed as to its costliness and as to its being within the reach only of the rich. The experience at Newcastle, where gas is only 1s. 10d. per 1,000 cubic feet, and at Bradford, shows that it is now within the grasp of the poor man. The average cost per electric lamp per annum at the former place was last year 6s. 3d., and at the latter place 9s. 7d. Electricity can now be produced cheaper than gas. He is now engaged, Mr. Preece goes on to remark, in determining the best and cheapest mode of fitting up small tenements, so as to bring the light within the reach of the poor. He estimates that the total capital required to light the whole parish will probably eventually reach 300,000l., but adds that it will take some years and much prosperity to attain that result. To comply with the requirements of the provisional order and to make a good start will

not require more than 75,000l., for which sum sufficient plant can be obtained to supply energy to 20,000 lamps alight at one time, which would mean 40,000 lamps fixed.

THE CRYSTAL PALACE, SYDENHAM.

AT the half-yearly meeting of the Crystal Palace Company, the chairman, Mr. G. T. Rast, observed that the past year had been full of trouble and anxiety, and it was not surprising then that a great institution like theirs should have suffered because they must all remember that, from the very nature of their building and grounds, they had a certain fixed expenditure which must be maintained, while they had a very uncertain revenue. They were committed to the opening of the electrical exhibition last year. Although an immense success from a scientific point of view, it was an immense failure from a financial point of view. In fact, their net receipts compared with those of a Handel Festival year, were about 8,000l. less, and this he attributed entirely to the exhibition, because their space in the building was blocked by it, preventing them from holding other shows. He regretted that the season-ticket receipts had fallen off by about 1,000l., notwithstanding the efforts they had made to increase their revenue from this source. With regard to the Crystal Palace Parade, the road would be completed in a few days, and he believed that it would be one of the finest in the suburbs. One of the shareholders said that the management ought to circumscribe the gardens and dispose of the land, which he understood they could do at a very high price. The Chairman in reply stated that they were always very willing to receive suggestions. As regarded the sale of the Palace, if a proper scheme were submitted for its purchase, it would have a very favourable reception from the directors, assuming that they were satisfied in regard to the position of the intending buyer and the price offered. His own opinion was that it would be desirable to secure for the public the Alexandra Palace in the north and the Crystal Palace in the south.

LINCRUSTA-WALTON.

WE have received some half-dozen or more new sheets, showing many new and beautiful designs for house decoration in Lincrusta-Walton. Those responsible for the designs are

certainly to be congratulated in being able to present so varied an assortment, the whole being characterised by such excellent good taste. To take the sheets seriatim we find one devoted to borders and sundries, others to door-panels and various other panels, ceilings, friezes, fillings, dados, &c. We cannot do better than recommend our readers to inspect the new designs, which are evidently the outcome of careful study by skilled artists. Among the figured work are door-panels, representing respectively Diana, Ceres, Flora and Pomona. The designs for ceilings and for friezes are all in appropriate character for the positions to be decorated, and specimens of bold and graceful treatment will be seen in the fillings, as well as in the dado work.

HIGH-CLASS PLUMBING.

WE note with satisfaction the increased interest taken in the employment of qualified plumbers, and the efforts made to raise this particular trade to a higher level. It is generally admitted that the arrangement of our drainage requires more than a rudimentary knowledge—in fact, a scientific training in

the principles of sanitation. We are glad to draw attention to this connection to a firm of registered plumbers, Messrs. Peattie & Axtell, of 1 Gloucester Road, South Kensington, S.W., and Oxford. Their experience almost entirely consists

of high-class West End sanitary work, hotels, mansions, flats, &c., attended with very uniform success. Every branch of the trade receives attention—drainage, of which the firm have a specially-devised system, bath fitting, hot and cold water fittings, heating apparatus, public bath construction, &c. Their large showrooms are stocked with every variety of

sanitary appliance in domestic use, plans of house drainage, and illustrations of works executed by the firm, amongst which municipal work has a prominent place. The principals of the firm give personal attention to the work, and we are confident that their success may be relied upon. We illustrate above modern patterns of lavatory and bath.

THE USE OF STEEL FOR CONSTRUCTIVE PURPOSES.*

STEEL is an alloy of iron with a small percentage of carbon and other elements in minute quantities, an alloy of iron which can be poured direct from the furnace in a state of fusion and cast into malleable ingots.

Vol. XLVIII. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

Carbon is supposed to be combined or dissolved, and special characters and qualities may be given to the steel by the introduction of manganese chromium, &c. The alloy of carbon and iron possesses the property of being hardened or tempered. So-called mild steel cannot be hardened; this contains 99½ per cent. of iron, and ½ per cent. of carbon. The process of manufacture eliminates all impurities from the iron before the requisite proportion of carbon is added.

Wrought iron contains 96 to 97 per cent. of iron interspersed with laminated slag. It cannot be poured in a fluid condition from the furnace, but is taken from the puddling furnace in a pasty, semi-fluid condition, and has to be rolled or hammered to be brought into a malleable condition.

The limit of elasticity of mild steel is greater than that of wrought-iron. 15 to 18 to 20 tons per square inch can be applied before any material extension and permanent set or deformation is observed.

The advantages claimed for mild steel as a constructive material over that of iron are:—The high range of the limit of elasticity in proportion to the ultimate tensile strength; its greater range of its elastic action compared with that of iron; its superior tensile strength over the latter material; its great power of endurance; and greater elasticity than that of iron; its remarkable ductility and resistance to impact; and that it is a more reliable material in every sense, and capable of standing more rough usage during process of construction.

Plates, angles and tee sections can be produced of greater length and width and area, so that fewer joints and connections are made.

Structures in steel can be made from 30 to 50 per cent. lighter than those of iron of the same strength. The structural strength is thus increased as the dead load is reduced due to the structural weight.

The tensile strength and elastic limit of mild steel plates are nearly the same lengthways as crossways.

As thinner plates in steel can be used in construction than those in iron, the rivetting of the structure is much stronger, due to the lessened length of the rivet.

The remarkable ductility of the mild steel as used for constructive purposes, provides that, with an ultimate tensile strength of 30 to 32 tons, and an elastic limit of 16 to 17 tons per square inch, it will have, after drawing it into wire, a tensile strength of 70 to 75 tons to the square inch. The elongation before drawing would be 15 per cent. in 12 inches, and after drawing 4 per cent. in 12 inches; and suspension bridge links

are purposely stretched and strained to the elastic limit, giving them more rigidity by destroying some of its elasticity than in their original condition.

The process of the manufacture of the mild steel is carried out with the greatest certainty and with uniform results so that the utmost confidence can be placed in the material. The iron used for the purpose is melted and completely deoxidised from all slag and impurities, and a pure iron is thereby produced; and then the requisite carbon is introduced, which thoroughly combines with the metal, and when cast the material called mild steel is produced. The proportion of carbon to the iron determines the ductility and character of the material as regards ultimate extension and elastic qualities.

The pure iron is useless as a constructive material, and only when combined with the requisite quantity and proportion of carbon does it become of use. Thus, as a combination of iron and carbon it is capable of assuming a condition remarkable for its great strength to resist fracture, and for its great ductility and elasticity. The mild steel which is now generally manufactured for constructive purposes is capable of resisting a tensile stress of from 28 to 32 tons, with an elongation of 20 to 25 per cent., and a reduction of area at fracture of 30 per cent. to 50 per cent.

This material is used in the construction of steam boilers, and these are now capable of being constructed of large dimensions, and to carry pressures of steam up to 200 and 250 lbs. to the square inch.

The marvellous ductility of the material is shown and illustrated in the manufacture of solid-drawn seamless air and gas cylinders and vessels. They are drawn by hydraulic pressure from a single piece of steel, either as solid cylinder or slab or disc; a mandril forces the metal through a die of the requisite diameter and produces a cylinder with an end, a solid end, and then a neck is drawn at the other end and so a vessel is produced of a cylindrical form in the shape of a bottle and can be made to an external diameter of 12 inches and a length of 7 feet 6 inches, with a thickness of half an inch, and this will stand a test of 300 atmospheres equal to 2 tons per square inch.

Examine specimen of a seamless cylindrical steel gas vessel, 7 inches diameter, 4 feet long, manufactured by Mr. Samuel Walker; the inventor being Mr. Howard Lane, of Birmingham; and a specimen of a circular flat disc of the material from which they are drawn.

See specimen of Dalzell steel which has been pressed by hydraulic pressure by a mandril into a bowl through a die.

READING CASES FOR THE ARCHITECT.
Price 2s.—Office: 175 Strand, London, W.C.

The same property enables the material to be used for the manufacture of projectiles. In the case of shells the effect of the explosion becomes much greater, in consequence of its enclosure in a material requiring great disruptive energy to fracture it.

The ductility of the mild steel is utilised in the manufacture of tubes, which upon being drawn through circular dies by hydraulic pressure over mandrils enable them to be produced as concentric seamless tubes, and of various thicknesses, the least being No. 22 gauge, about 1-30th of an inch in thickness, and these can be made from $\frac{1}{8}$ inch to $1\frac{3}{8}$ inch thick; they can be drawn 2 inches, &c., No. 16 gauge thick, 1-17th inch thick. The tubes possess great strength compared with their weight, and these are made for the manufacture of cycles, a manufacture which has become an important item in our home industries. A cycle can be made for racing purposes not to exceed 14 to 15 lbs. by means of these steel tubes. A specimen was exhibited to illustrate this.

The steel plates and angles are also used for the manufacture of ships. The dead weight is not only less, enabling more freight to be carried in proportion to the displacement, but they are made stronger, capable of withstanding impacts and shocks beside the multitude of twisting and transverse strains which are constantly happening to a ship. The nature of the material is of advantage for these structures, as the strength is about the same across the plate as lengthways.

A sketch from *Engineering*, January 20, 1893, was exhibited of the effect of a collision on a torpedo boat made of steel plates, with a tensile strength of 27 tons to square inch.

It was used in the construction of the Forth Bridge, a structure both novel and exceptional in its details, having to support its own enormous load beside that of the moving load (viz. two railway trains at express speed) and to withstand the effects of cold and heat which probably produce greater internal stress on the structure than the effect of the moving and dead loads.

Quoting from remarks made in *Engineering*, February 28, 1893, in the description given of this structure and the material used:—

"The choice of a material for constructing a bridge of novel design, of extraordinary magnitude, and exposed during erection to the effects of powerful atmospheric disturbances, must have been the subject of much anxious thought and reflection to the engineers. But, in whatever way the decision was arrived at, there can be no two opinions that the choice

was a happy one. From beginning—and probably a long time before the beginning of this work—to the end this steel was subjected to every conceivable test, both in a properly scientific manner, for purposes of research and investigation, and in an entirely unscientific manner by workmen, whose only excuse can be that they did not know better. But in all cases the steel stood the test, and a more uniform, a more homogeneous, and more satisfactory material could not be wished for. The Board of Trade's stipulations in regard to structures do not go further than to lay down the rule that the maximum working stress should not exceed one-fourth of the ultimate breaking strain of the steel. No difference is made between the tensile and compressive stresses, nor is any regard paid to the differences between stresses due to dead load or live load, alone or in combination, nor to the circumstances arising from changes occurring frequently or rarely in the nature of the stresses. The engineers, therefore, laid down after consultation with the Board of Trade, and with their approval, certain rules in regard to the stresses admissible under varying circumstances. For tension members the steel was to have an ultimate resistance of not less than 30 nor more than 33 tons per square inch, with an elongation in 8 inches of at least 20 per cent. For compressed members a resistance of not less than 34 tons, nor more than 37 tons per square inch, with 17 per cent. elongation. With regard to varying stresses for a load varying between *nil* and a maximum, 20 tons per square inch of section to be assumed as the ultimate strength if the change occurs frequently, and 22½ tons if occurring rarely.

For stresses alternately tensile and compressive, the ultimate stress to be 10 tons if frequent, and 15 tons if seldom, one-third of the ultimate strength to be considered the working stress. The rivet steel to have an ultimate strength of 27 tons 30 per cent. elongation, and shearing resistance to be 22 to 24 tons per square inch. For tension members the sectional area of the rivets in the joints to be one and a half times the useful section of the boom, and for compression members the rivet area in butt joints to be half the useful section of the member. The steel supplied was from the London Steel Works of Messrs. Siemens, the Steel Company of Scotland, the Dalzell Company near Motherwell, and the Clyde Rivet Company for rivets.

The adoption of the amount of stress to be put on a structure within this limit is a matter for preference and judgment. The factor of safety can of course be lower for the support of dead loads exclusively, and the settlement for live loading is a matter for specific determination, and has to be determined

VOLUME XLVIII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.

OFFICE:—175 STRAND LONDON W.C.

by the nature of the structure, and the details and method of its loading.

A number of selected specimens of steel, in the preparation of which Mr. Thomas Beeley, of Hyde Junction Works, Manchester, has kindly assisted, are exhibited, to show the breaking strain and ultimate limit of elasticity, and to show the ductility of the steel, of which the following is a list.

The following examples of construction (which were illustrated by wall diagrams) have been manufactured and erected during the last ten years:—

Example of a Roof Principal 61 feet Long, at Old Street Manufactory.

14 feet 6 inches deep, with 4 by 3 by 7-16 top and 4 by 3 by $\frac{3}{8}$ steel angles at bottom, with light angles and flat bars for the cross bracing. It supported a slate roof, wood, timbers and boards, with glass on each side at the top. Hoisted into position as one piece.

Example of a terminal principal of the roof supporting its own share of its end bay and itself, 63 feet in length, and one end of six principals of adjoining roof at right angles to it, 63 cwt. each. The depth of principal at centre is 15 feet, and is composed of 7 by 3 $\frac{3}{4}$ for top, and 8 by 4 steel rolled girders, with cross bracing as shown. The lower member had to be strong enough between brace connections to support the ends of principals.

The total weight supported is 25 tons, 12 cwt. and the weight of principal 35 cwt.

A Steel Roof Principal over Battersea Town Hall.

Mr. E. W. Mountford, Architect.

These were 56 feet span, and a height from springing of 35'4 feet, and to soffit 18 feet, which is constructed of an elliptical shape. The bases are 1 foot 4 inches wide, giving a total length of 58 feet 8 inches. The top and bottom members are of 4 by 4 by $\frac{1}{2}$ steel, see section, a steel plate is carried up 18 feet from supports, and the bracing from that is 3 $\frac{1}{2}$ by $\frac{1}{2}$ flat, 3 by 3 by $\frac{3}{8}$ angle, 4 by $\frac{1}{2}$ flat, 3 by 3 by $\frac{3}{8}$, with a vertical eye of 4 by $\frac{1}{2}$, all in steel, a plate 10 feet long, 4 by $\frac{1}{2}$, is rivetted on top member, from the $\frac{3}{8}$ web to the first intersection of brace.

Battersea Town Hall. Roof over Council Chamber.

Mr. E. W. Mountford, Architect.

Two principals, 35 feet span of steel angles and flats, rise 22 feet 6 inches. The tie bar is curved to a radius of 23 feet.

Two principals, same span, but with flat top as shown. Principals 11 feet apart.

Roof over the Hall of the Mark Masons.

Mr. C. Driver, Architect.

The roof of this hall was desired to be carried in one span of 41 feet 9 inches between the walls, and to give a clear height of 21 feet from floor to ceiling, while one wall was only 14 feet 6 inches from floor, and it was not permissible to raise it while the roof was to be supported within a limiting angle from the edge of the wall, and from this angle limiting line to the ceiling, which was required to be curved, the way was only 12 inches. The roof principals were designed and carried out. They were 42 feet 9 inches over all, 3 feet deep at the centre, with a rise of curvature of 8 feet from the pring. The lower flange was level and the upper angle shaped for centre to curved ends. The depth at entry of curve was 12 inches, and at the tangent of the limiting line 1 inch deep. The web was $\frac{1}{4}$ thick throughout and the flanges top and bottom of 4 by 3 by $\frac{3}{8}$ steel angles. The bases of the ribs were supported and firmly connected to 6 by 5 r.i.j., 24 feet 6 inches long, which were secured to walls and piers. The girders for the floor of hall were connected to it as well as those supporting the floor beneath at the base of the stanchions. The construction carried out its intention and was a firm and stable structure, and produced no thrust whatever on the old walls of the building.

An Example of a Roof Rib of Lattice Work at Walthamstow Hall.

Bracing 48 clear span and 20'6 rise. It was delivered and hoisted into position in two separate portions and connected and rivetted together at the central line. The members were of 4 by 4 by $\frac{1}{2}$ T section with angles for cross-bracing. This produced no thrust on the side walls which were light.

The total height from roof supports to apex is 26'6.

An Example of an Octagonal Dome on Tower, St. Joseph's Retreat, Highgate.

Mr. A. Vicars, Architect.

This was constructed of eight steel ribs, 22'3 rise, and with a clear span of 38'6. They were 3'0 at base, 1'0 at crown, and all the covering fitted, and were fixed to a central ring 8'c diameter, 1'6 deep. The webs of 5-16 steel-plate flanges

VOLUME XLVIII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.

Office: 175 Strand, London, W.C.

of $2\frac{1}{2}$ by $2\frac{1}{2}$ by 5-16 steel angles. The purlins of $6\frac{1}{2}$ by $3\frac{1}{2}$ rolled-steel girders, and they, and a base tie of 6 by 3 channel steel were connected to the ribs all around. At the ring was constructed a lantern dome, and the roof was covered with copper sheathing. The ring was of 18 by $\frac{1}{4}$ steel and 4 by 3 by $\frac{3}{8}$ steel angles. The ceiling was constructed and supported on the inner flanges of the roof ribs. The thrust was completely taken by the construction.

An Example of a Curved Roof Rib of Steel Erected at Westminster Meeting House in October 1882.

It is 35.6 clear span with a rise of 14.9, clear depth at centre of rib 24" and width of feet 16". The web of $\frac{1}{4}$ plate and the angles of flanges 4 by 4 by $\frac{3}{8}$. The connection was made at the centre on the site, the two purlins being the two half-ribs with connecting angles and plates and cover angles on the angles of flange, and riveted in position on the site. The purlins, eight in number, were of 8 by 4 rib-joists. This is a light construction, and is designed to produce no thrust on the side walls of hall, and the result is a structure of simple rigidity.

Steel Girders for a Travelling Crane.

The crane is capable of lifting and lowering a dead weight of 20 tons, and with the weight of crab and machinery and allowance for rolling and moving load, each girder is calculated to support a central load of 20 tons, and this will give a stress on the flanges of $7\frac{1}{2}$ tons per square inch. The girders are 58 feet long, 15 inches wide, 3 feet deep, with thirteen available sections in the flanges. The girders are supported by the upper flange by bolts and by a plate which passes down from the carriage girder, and is bolted directly on the end of the girder, so the bolts supporting them are in shear and in tension. The girders are of the box form, the flange plates 15 by $\frac{1}{2}$, angles 3 by 3 by $\frac{1}{2}$, and the webs 5-16 thick. This illustration is given to show that a girder of steel will support a dead and rolling load unsupported sideways and in motion, liable at all times to sudden jerks and vibrations, and supported by bolts slinging it to its moving support.

Method of Trussing an Iron Girder, 60 feet long.

This was supported by a column in centre making two spans of 30 feet each by steel bars. This construction is at the works of R. Moreland & Son, supporting an end of a travelling crane. The girder was 15 inches deep, 14 wide, and weighed 3 tons 8 cwt. It was stoned and the column removed and the truss

added. It was made by affixing three double T standards of 6 by 3 by $\frac{1}{2}$, 6 feet long, with tie bars of 2.9 by $\frac{7}{8}$. Steel with cross bracing and lower tie of 8 by $\frac{3}{4}$. Steel bars double. The strength of this compound girder is equal to supporting a weight of 27 tons as a live and dead load. The weight of steel in the added truss was 38 cwt.

(To be continued.)

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

1985. James Joseph Sumner, for "Improvements in attaching door-knobs to doors and such like."

2056. Horatio Saqui, Ernst Jahncke and the "Future" Bolt Syndicate, Limited, for "Improvements in bolts or fasteners for doors, windows and the like."

2095. William Thomson, Baron Kelvin, for "Improvements in taps for water and other fluids."

2151. Frederick Egge, for "Improvements in and relating to padlocks."

2198. William Thomson, Baron Kelvin, for "Improvements in balances."

2275. Henry Harris Lake, for "Improvements in sash fasteners."

2297. Alfred Hemming and Frederick William Drewitt, for "Improvements in fire and other guards or screens."

2346. Edwin John Cheyney, for "Improvements in cocks and ball-valves."

2438. James Jemson, for "Improvements relating to stoves and fireplaces."

2491. William Newby Colam, for "Improvements in and relating to grip pulleys."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

THE DENSMORE.**THE WORLD'S GREATEST TYPEWRITER.**

TO ARCHITECTS.—If you have come to the conclusion that the use of a Typewriter for writing your Specifications and Contracts will SAVE YOU TIME AND MONEY, give the DENSMORE a thirty days' trial before purchasing any other.

The Machine may then be returned if not found satisfactory in every respect, and a decided advance in typewriting mechanics.

If you decide to purchase it, we guarantee it free from all mechanical defects, and keep it in order for two years free of any charge.

TWO CARRIAGES, fitted with SOFT and HARD CYLINDERS, which are instantly INTER-CHANGEABLE, are furnished with each Machine without extra charge—thus one DENSMORE performs the work of two ordinary machines.

NO LIFTING OF CARRIAGES REQUIRED IN ORDER TO SEE YOUR WORK.

If you require anything in Typewriting Supplies, give us a call and look over our stock. We have seventy-five different grades of Typewriting Papers and a large stock of the best Carbon Papers. Typewriting of all kinds neatly and promptly executed by a corps of skilled operators.

TRADE NOTES.

At a public meeting of owners and ratepayers of the district of the Runcorn Improvement Commissioners, a resolution was passed in favour of purchasing the undertakings of the Runcorn, Weston and Halton Waterworks Company for 67,000l.

A LARGE clock has just been erected upon the tower of the parish church, King's Norton, Worcestershire, by Messrs. John Smith & Sons, Midland Clockworks, Derby. It has been constructed generally to the designs of Lord Grimthorpe, and has all the latest improvements. It shows time on two dials each 6 feet across, chimes the Westminster quarters, and strikes the hours upon the large tenor bell. Apparatus is fitted to maintain the action of the clock during winding. The escapement is a double three-legged gravity one, and the pendulum

ELEVENTH ANNUAL
BUILDING EXHIBITION

Of all Industries connected with the
Building Trades,
MARCH 11 to 25, 1893.

"THE ARCHITECT" says of the 1892 Exhibi-
tion:—

The representatives of all industries connected with the
building trades will be wise to commence at once their pre-
parations for the Exhibition. There cannot be as loud a pre-
liminary flourish about an Exhibition in Islington as there is
always about one of those designated as "international";
but if exhibitors will consider the results of the two classes,
they will discover that in the former they have met men of
business and received orders, while for the privilege of par-
ticipating in the universal shows they have not only lost
large sums, but discovered that the dilettanti and holiday
makers, who constitute the mass of visitors, are not fasci-
nated by the best aids to construction.

JOHN BLACK, Secretary.

bitions, 1885 and 1886.

compensated for atmospheric variations. The same firm are also making two large clocks for West Bromwich, one for Tunstall, Staffordshire, repairing the large clock at St. George's Church, Birmingham, and other works in the same neighbourhood.

WE are informed by Messrs. Le Grand & Sutcliff that, in consequence of large expansion of business, they have removed their Magdala works and offices to extensive new premises they have just erected near the City end of Bunhill Row, within four minutes walk of Moorgate Street Station.

THE Public Parks Committee of the Edinburgh Town Council have authorised estimates to be got out for new greenhouses in lieu of those displaced by the railway extension in Princes' Street Gardens, to be erected in Inverleith Park. The committee accepted the estimates of Messrs. John Morris & Sons, contractors, amounting to 1,077*l.* for the embankment and the planting of trees and shrubs in East and West Princes' Street Gardens.

TENDERS have been received by Messrs. J. P. Jones & Rowlands, architects, of Wind Street, Swansea, for pulling down premises in Temple Street, Castle Bailey Street, and Caer Street, for Messrs. Ben Evans & Co., preparatory to rebuilding as follows:—Mr. David Jenkins, Messrs. Thomas Watkins & Co., Messrs. Evans & John, Messrs. Gustavus Brothers, Messrs. Thomas Waters & Co., Mr. John Grove and Messrs. Holway & Parsons. The tender of the latter has been accepted.

It has been intimated by Messrs. Mather & Platt, of the Salford Ironworks, to their employes that they intend to try the experiment of working only forty-eight hours a week instead of fifty-three as hitherto. The experiment is to extend over twelve months, and the firm hope to be recouped to a considerable extent for the sacrifice by increased energy and greater punctuality on the part of their servants. The start before breakfast will be abolished.

THE Streets and Buildings Committee of the Edinburgh Town Council recommend the widening of the pavement in Greenside Street, and the widening of Canonmills Bridge on the south side.

At Calverley the Joint Hospital Board have accepted the tender of Messrs. D. Hinchliffe & Co. for the reconstruction of the drainage and sewage works of the fever hospital, opened two years ago, and also the tender of Mr. F. W. Higginbotham for the plumbing work.

THE contract for new harbour works at Eupatoria, in the Crimea, together with a short line of railway connecting the port with the Crimean railway system, has been given to a French syndicate.

THE following directors have been added to the London board of the London and Lancashire Fire Insurance Company:—The Marquis of Exeter and Mr. F. R. M. Phillips (Messrs. Gush, Phillips, Walters & Williams).

THE Jubilee Festival of the Iron, Hardware and Metal Trades Pension Society will be held during May. The Prince of Wales, with his customary kindness, has consented to preside, on the distinct understanding that there will be a generous support of the charity, of which the Duke of Norfolk, K.G., is president and Mr. Howard J. Kennard vice-president.

ELECTRICAL.

THE Gas Committee of the Leicester Corporation recommend the Council to accept a tender of the Brush Company to introduce an installation of the electric light into Leicester at a cost of 27,000*l.*, and to borrow 50,000*l.* to erect the necessary buildings and provide working capital.

It is proposed to have the new free library at Southampton lighted by electricity, the cost of which has been estimated at about 400*l.*

BUILDING AND BUILDERS.

THE Leeds County Council have authorised a grant of 2,000*l.* for the erection of a caretaker's house, with store-room, cooking kitchen, washing and drying houses, including fittings, to be used for sanatorium purposes at Manston, and a grant of 3,000*l.* for the erection of a smallpox hospital on the Manston Hall Estate capable of accommodating about twenty-five patients.

THE contract for the Croydon Municipal Buildings has been awarded to Messrs. W. H. Lascelles & Co., the amount being about 61,793*l.*

THE Oxford Town Council have accepted the tender of Mr. John T. Chappell, at 51,663*l.*, for the municipal buildings, which was the lowest on the list. The second lowest, 53,852*l.*, was from Mr. S. Hutchins; the highest tender, from a Plymouth builder, being 71,414*l.* The total cost is estimated as follows:—Tender, 51,380*l.*; commissions, 5,203*l.*; heating and carving, 5,000*l.*; fittings, 4,300*l.*, or a total of 65,883*l.*

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 14 inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

CASES FOR BINDING THE ARCHITECT.
Price 2s.—Office, 175 Strand, London, W.C.

A COMPANY has been formed to purchase a city office property in Johannesburg, Transvaal, known as "Green's Chambers," situate in the centre of Johannesburg, for the purpose of erecting the Johannesburg Safe Deposit Company's buildings. The intention is to pull down the present building of iron and wood, which is quite obsolete in style, totally unsuited to its excellent business surroundings and unrivalled situation, and to erect immediately a handsome building of permanent material two or three storeys in height, similar to the commercial buildings on each side of it. As there is a pressing demand for the establishment of a safe deposit in Johannesburg, estimates have been obtained from Messrs. Ratcliff & Horner, Limited, who have had similar contracts in other cities, and are at present constructing the Edinburgh Safe Deposit, the New London Safe Deposit, and a duplication of the Chancery Lane Safe Deposit, and it has been decided to utilise the basement of the property for this purpose. The area thus set aside will allow sufficient room for the construction of 2,000 steel fire-proof and thief-proof safes of varying sizes, and strong rooms for the use of merchants, bankers and others. The managing director of the company has just left for Johannesburg, and Mr. G. Lennox Canning, the architect, is also on the point of departure. The capital has been over and above subscribed.

CHICAGO EXHIBITION NOTES.

AN interesting exhibit at the World's Fair will be a model of the island of St. Thomas, Danish West Indies. It is about 8 feet by 4, built to a scale of 6 inches to the mile, painted in natural colours, showing the roads, country houses, ships and steamers in the harbour and the pretty town of Charlotte Amalin, with its two old legendary towers of Blackbeard and Bluebeard.

THE flag carried by Pizarro and his followers during the conquest of Peru will be a notable object in the Venezuelan exhibit at the World's Fair. The sword of Cortez will be exhibited from Mexico.

HAYTI'S building at the World's Fair, a unique and artistic structure, has been completed, and was dedicated on January 2, the anniversary of the independence of Hayti.

GOUPIL & Co., of New York and Paris, have been conceded the important privilege of making an illustrated publication of the contents of the Woman's Building.

THE inter-continental railway commission has had prepared a facsimile in miniature of Central and South America, to show the surveys of the proposed railroad intended to unite the systems of North and South America. The work was done by Mr. E. E. Court, of the Hydrographic Office.

THE Great Western Railway Company are sending out to Chicago their famous old broad-gauge engine "Lord of the Isles," which was exhibited in the London Exhibition of 1861 and the Edinburgh Exhibition of 1890.

THE firm of shipbuilders, Messrs. Laird Brothers, Birkenhead, despatch to Chicago a number of models intended for exhibition in the British section of the World's Fair. These will include specimens showing the development of the ship-building trade, among them being models of some of the present-day Atlantic liners and other famous vessels built by the firm.

THE municipal authorities at Copenhagen have decided to send Tuxen's picture of the Danish Royal Family to Chicago to be exhibited at the World's Fair.

BAIRD, THOMPSON & CO.

A SHORT time ago we referred to the additions and re-arrangement of the staff of this firm, and now, in order to cope with the increasing demand for their well known systems of ventilation, &c., and specialties, and continue to give each individual order their usual prompt attention, they have found it necessary to remove their offices and show-rooms to larger and more commodious premises. They have, therefore, secured the handsome premises situate at 159 Queen Victoria Street, E.C. (two doors east of those lately occupied by them). These are being fitted up with every modern improvement in ventilation, heating, sanitation, &c., including a splendid installation of electric light, generated by themselves—a 2,000-power arc lamp lighting the outside, power for which is supplied by one of Messrs. Robey & Co.'s, Lincoln, latest improved type of gas-engine, in working order, to allow their numerous clients and visitors to examine and judge for themselves which special system or specialty will be most suitable for their requirements. The rapid strides this firm have made of late years are almost phenomenal in connection with the science of ventilation and sanitary engineering. We wish them success in their new enterprise, and congratulate them on the circumstances which have led to it. The new show-rooms are well worth a visit.

VARIETIES.

AFTER a lengthened respite another landslip has occurred in the Yorkshire fishing-town at Robin's Hood Bay from the precipitous cliff, injuring two houses. Further subsidences will jeopardise the safety of the Wesleyan Chapel. The town is one of the quaintest on the coast, the houses and other buildings being fantastically perched in considerable part along the cliffs.

At the meeting of the Watch Committee of the Liverpool City Council a deputation attended and urged upon the committee the necessity of some efficient measures being taken for the early extinction of fires. It was recommended that more extensive fire appliances should be provided, and also an increased number of stations should be erected at convenient points throughout the city.

THE *Leeds Mercury* says that the Asylum Committee of the Middlesbrough Corporation have agreed, subject to the approval of the Lunacy Commissioners, to purchase from the trustees of the late Mr. H. Bolckow 106 acres of land for the sum of 10,000*l.*, or at the rate of 94*l.* 13*s.* per acre.

THE Polytechnic Young Men's Christian Institute, Regent Street, have arranged for "co-operative excursions" to the Chicago exhibition and also to the Norwegian Fjords during the months of May, June and July. The excursions are arranged for those of limited means who otherwise would be unable to take advantage of either excursion.

THE Gainsborough Local Board have resolved to apply to Mr. Jabez Church, C.E., Westminster, to carry out the work of deepening the bore at the artesian well, and enlarging the well itself. The estimated expense is 8,000*l.*, but as a new engine-house will have to be built and other matters carried out, it was decided to apply for powers to borrow 10,000*l.*

ON Wednesday Sir Henry Trueman Wood, secretary of the Royal Commission for the Chicago exhibition, sailed for America by the *City of Paris*, to take charge of the British section at Chicago, where he may be expected to arrive about March 6.

At the meeting of the Manchester Association of Students of the Institution of Civil Engineers, Mr. W. Cooper read a paper on the "Practical carrying out of Main Drainage Works," Mr. L. B. Wells, president of the Association, in the chair. Mr. Cooper described the setting out of the works, and the methods of sinking and timbering the shafts. He explained

the mode of excavating sewers under varying conditions, and how the headings were driven and timbered. He also showed how the brickwork was built and the sewer completed.

THE second annual report of the Yorkshire Sanitary Association has been issued, showing a record of what has been attempted during the year, in aid of improving sanitary conditions. The danger of relying upon filters as an absolutely safe precaution against the impurities in water are pointed out, and it is strongly recommended that where sources of undoubted purity are available, the water from them should be used without allowing it to pass through any cistern or filter.

A STEAMER intended for the Great Eastern Railway Company's Harwich Continental Service was launched from Messrs. Earle's Yard at Hull, on Tuesday, February 21. This vessel is a steel twin-screw steamer 300 feet in length by 34½ feet beam, fitted with two separate sets of triple compound engines, which are expected to develop 4,500 horse-power, the builders having guaranteed a speed, when fully loaded with passengers and cargo, of 17½ knots per hour. The christening ceremony was performed by the Mayoress of Chelmsford, the vessel being named after that town. She is fitted with all the latest improvements for about two hundred first-class passengers, and is intended for the new route to the Continent from Harwich *via* the Hook of Holland, which is expected to be opened on June 1 next.

At the meeting of the Glasgow Association of Students of the Institution of Civil Engineers, Mr. John Cowan, jun., vice-president, in the chair, a paper was read by Mr. H. C. Lobnitz, student, on "Long Shoot Dredgers: their Design and Mode of Working."

AN inquiry has been held by the Local Government Board at Bradford relative to a proposal to borrow 100,000*l.*, mainly for sewage and electric lighting purposes.

At Smethwick inquiry has just been held by the Local Government Board respecting an application made by the Local Board for sanction to borrow 20,000*l.* for sewerage works and 3,070*l.* for works of street improvement. The Local Board has already carried out a considerable portion of the sewerage scheme, and spent 27,000*l.* on the work. The estimated cost of the proposed works is 19,975*l.*

THE Corporate Property Committee of the Leeds Corporation have decided to purchase a large field adjoining Kirkstall Abbey for the purpose of extending the grounds.

STRENGTH OF CONCRETE.

THE paper which was read before the Society of Architects by Mr. H. W. Chubb referred to the use of concrete as a material in building fireproof structures. The specimens of concrete which Mr. Chubb mentioned as having been tested by Mr. J. J. Webster, M.I.C.E., had been specially prepared. The following table shows their composition, together with the results which were obtained :—

Nature and proportions of materials in Concrete Briquettes.	Average weight per cubic foot.	Breaking weight per square inch at 60 deg. F.	Breaking weight per square inch after being heated and quenched.	Average loss per cent. of original strength after heating and quenching.
Neat Portland cement	lbs. 124·6	lbs. 554·6	lbs. 117·2	per cent. 60·8
1 part cement, 1 part sand	120·9	448·0	93·0	80·0
1 " 3 parts sand	111·2	100·8	18·7	81·4
1 " 5 " " "	109·7	74·6	15·0	79·8

THE EARTHQUAKE IN ZANTE.

A SPECIAL correspondent of the *Times*, in describing the effects of the late earthquake at Zante, says :—The extent of the recent disaster can hardly be realised at once, and the visitor,

as he steps ashore at the landing-place in the harbour, is inclined to think that the accounts which have reached him must have been exaggerated. He sees the large buildings around him standing apparently uninjured ; he notes that the plaster has in many places fallen from the walls, but this might be the result of neglect. It is not until he begins a thorough investigation that he comes to understand what a terrible catastrophe has taken place. The larger houses, owing to their greater weight and solidity of construction, have suffered least, but not one of them has escaped without damage of some kind. Leaking roofs, cracked and gaping partition-walls and fallen ceilings, are to be found in mansions which still present a tolerably fair exterior. The appearance of the streets in the better part of the town is quite delusive. The street fronts of the houses, built on arches in Italian fashion and recalling memories of Bologna, are almost intact, owing to their strong construction, while the walls on the other sides and the roofs have either fallen or are in a ruinous condition. The greatest devastation has taken place in the poorer quarter of the town, where the ill-constructed buildings were unable to resist the repeated shocks, and fell in such total ruin that in many cases nothing now meets the eye but heaps of stones, rafters and broken tiles. It is touching to see how the unfortunate people still cling to the remnants of their abodes—to see a family still living in the corner of a cottage, the rest of which has been reduced to ruins, or to stand by the bedside of the sick in some miserable hovel, where the gaping roof and walls admit the bitter wind and the rain.

A visit to the country district conveys a still more striking impression. The beautiful and fertile region which lies between the eastern coast and the mountains which form the backbone of the island is densely populated, and numerous country houses and peasants' cottages peeping out amid the foliage bear witness to the well-being and prosperity of the inhabitants. Here again the larger houses, which for the most part belong to wealthy townsfolk, have resisted the shocks of earthquake, but the peasants' cottages are almost all in ruins. Not far from the foot of the mountain lies the larger village of Macherato, with a population of 200 families. Here, according to the statements of the mayor and others, only six houses remain inhabitable. Of the two large churches, one has suffered severely ; the other, a new and strongly-built structure, has escaped fairly ; in both cases, as in the town of Zante and elsewhere, the steeples and belfries remain uninjured. Only one of the numerous steeples in the capital has received damage,

while several churches have fallen in. Fortunately the Zakyntians, unlike the inhabitants of the Riviera, are not given to seeking refuge in their churches in times of earthquake.

The village of Buyato, which lies in the same district, has suffered even more severely than Macherato. Not half a dozen houses remain fit for habitation, and in many places there is nothing more than a heap of stones to indicate where a peasant's cottage formerly stood. I learned from the villagers that the first shock of earthquake did less damage here than the second, though the former was elsewhere felt to be the most severe. In other villages the devastation, though less apparent, was hardly less real. At San Dimitri, a village of 110 families, I was informed that only two houses remain fit for habitation. At Skulikato, a charming little town standing in the midst of orange and lemon groves, only three houses, so it was stated, remain intact. Here a curious disaster happened to the church steeple, which was topped with a large iron cross. The cross fell, bringing with it some 3 or 4 feet of the masonry, but the rest of the steeple stood uninjured.

From these examples, which are typical of what has occurred all over the island, the reader may form some idea of the magnitude of the calamity which has befallen unhappy Zante. Only one village, Galaro, which lies among the higher mountains, has escaped the prevailing devastation. The total loss of property is estimated by experienced observers to exceed 600,000*l*.

BRAY ELECTRIC LIGHTING.

A PORTABLE telescopic ladder, made for use in connection with the electric lighting of Bray (Ireland) public streets, has been designed and constructed by the well known patent extension ladder makers, J. H. Heathman & Co., 2 and 37 Endell Street, London, W.C., and telescopes from 18 feet to 33 feet, having a platform at top upon which the lamp-trimmer sits, and grapnel-hooks are affixed to take over the arms on the lamp-pillars. The whole is mounted upon a four-wheeled carriage, and a spacious tool-box is provided. It was made to be drawn and used by one man, but the distance of 1½ miles having to be covered to control the whole of the lamps it was found desirable to affix shafts for draught at quick pace by a pony. The sliding-ladder is raised by means of a rope over a pulley, and it can be arrested at any rung, so that it suits lamps of varying heights.

UNION OF CAPITAL AND LABOUR INTERESTS.

THE *Oldham Chronicle* says:—On Saturday afternoon a visit was paid to Falcon Ironworks, Ashton Road, Oldham; the extensive machinery works of Messrs. John Wild & Co., Limited. Leaving the offices, the party first visited the machine erecting room on the ground floor, which was found to be well arranged, and containing some of the latest patents of machines in course of erection. The first one viewed was one of Fairbairn's patent screw rolling machines, specially designed for making screws for wood such as railway sleepers. This machine, when completed, will be sent to Russia. The second was a portable hauling and winding machine, designed for underground work, such as collieries, &c., and one made to withstand rough work. These are so simple that they can be fixed and handled by unskilled workmen, and moved about the mine. A large number of these machines are at present working in the South Wales collieries. A horizontal boring machine was also viewed with great interest. Here were two large cranes used for lifting machines on the luries prior to being delivered. The next room visited was the pattern store-room, which contained patterns of all descriptions. On leaving this place the visitors inspected the room in which machines for wood cutting and planing are made. Here an improved hand power feed planing machine was seen. There were seen quite a large number of different kinds of machines for wood-work being erected, such as double panel planing machines, side planing machines, wood boring machines, all suitable for joiners and cabinet makers. The horizontal board cutting-machine, specially designed for cutting up valuable wood, such as walnut, mahogany, &c. Only one board is cut at once from the log, thereby allowing the workman to see the full development of the grain as the timber is being sawn. A machine which is in great demand is the band saw machine. This machine is fitted with improved pulleys of cycle pattern, and are accurately balanced, and have their rims covered with indiarubber, so as to form an elastic bed for the saw. A great feature of this machine is that no screw-keys are required. The visitors were also shown two patent governors that had been on view at the Midlands Ironworks Exhibition. Instead of the central weight a spiral spring is employed, and as the valve lowers the spring is compressed. The next room visited was the pattern room, and we may here say that the directors intend building a foundry of their own to do their own castings. The visit throughout was both enjoyable and instructive. The same afternoon the workmen of the Falcon Ironworks, along with their wives and

Reading Cases for the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

sweethearts, to the number of 112, were invited by the directors to spend a social evening at the Conservative Club, Greengate Street. After a substantial tea had been partaken of, a concert was held.

Mr. John Wild occupied the chair, and in his remarks said he was pleased to be present amongst them at that, their fourth annual gathering, and he hoped he would have the pleasure of being present at the forty-fourth. They had been busy at the works considering the prevailing trade dispute. They must bring out good work, and at the same time do it cheaply. What the directors desired to do was to get a reputation for good work, and without the assistance of the workpeople they could not get a dividend. He concluded with hoping they would all spend a pleasant evening.

Mr. J. H. Fisher said as a co-director he gave them all a hearty welcome. That was the fourth gathering at which he had been present, and he hoped they would all continue to work in the interests of the company.

Mr. J. S. Hulton said the thing that came uppermost to most of their minds at the present time was the unhappy struggle now being waged. He was afraid that a dispute between capital and labour was like a quarrel between husband and wife, and when the end came—and come it must—there would be searchings of heart on both sides. They all knew how difficult, and even dangerous, it was to interpose between man and wife, and although attempts at mediation had been made in high places in the present instance, they had proved equally perilous and futile. That the struggle was a costly one no one doubted, for it had already cost the operatives a sum of about 100,000%, but what it had cost the employers it was very difficult to estimate. To take sides on an occasion like this would be in very bad taste. The question of wages, or what was a fair day's wage for a fair day's work, bristled with difficulties, but when next the operatives had another 100,000% to spare he would like to see them build a mill of the most modern type, equipped with the best machinery that skill or ingenuity could devise. Then let them pick out their best workpeople and their best managers. Let them send their salesmen in the open market for orders, and without any speculation in the raw material, buying cotton only to cover their orders; and, as a result, let us see what remuneration they have for their capital. Those of them who were mere onlookers would then be able to form a more accurate judgment upon the question of wages in this particular branch of trade. Whilst he was not prepared to say that the

workpeople were unreasonable, on the other hand he knew that the "cotton lord" of to-day was far from avaricious, for what with foreign competition and the still more fierce competition at home, he was now contented with a fair remuneration upon the capital he employed; nay, in many cases, both the iron-master and the cotton-master received but a meagre return upon their outlay.

Mr. Wm. Williams moved, and Mr. Wm. Fletcher seconded, a vote of thanks to the chairman and directors.

During the evening songs were given by Miss Stringfellow, Mrs. Thornley, Mr. Crompton, Mr. Barlew, Mr. Needham, Mr. S. Milner and Master Broadbent, in a very creditable manner. Two recitations were given by Mr. Bradley in a pleasing style. Well rendered glees were given by the Oldham Central Glee Union.

WATER SUPPLY OF FLORENCE.

THE special commission nominated by the City Council to find a supply of pure spring water for Florence have terminated their labours, the result of which is embodied in an exhaustive report. The city would give to a properly-constituted company or syndicate offering substantial guarantees the right of supplying water to the inhabitants of the town for sixty years. The sum which would be required to carry out the works is 25 million lire, or, in round numbers, a little less, counting exchange, than a million sterling. The water rates now produce to the city an annual profit of 300,000 francs, but the present quantity is insufficient to satisfy the requirements of the whole population, and it is estimated that with an abundant supply of water the present consumption would be more than quadrupled. The city authorities would compel all the present wells of the town to be closed, and thus force the population of the whole commune to use the projected water supply for every purpose. It has been decided that all the waters should come from one source or group of springs, in order to maintain an unvaried quantity and quality. In the Garfagnana region, some distance beyond the baths of Lucca, there is a spring of water called the Pollaccia, of a delicious, limpid quality. The water has been analysed and found to be chemically pure. The surroundings, too, are good, the sources of the spring being at a good altitude, in a rocky, mountainous region, almost bare of vegetation and free from any possible source of organic contagion. The necessary quantity and quality of "excessively pure" water having thus been assured in the Garfagnana, where one spring has already been purchased, the commission recom-

mend the following project:—To bring the water from two separate springs which united would give 600 litres per inch, and to add a third when 900 litres are required. The aqueduct would start from Pollaccia, at 550 mètres above sea level, and join the springs of Gangheri at 255 mètres above sea level. It would then pass through various tunnels and cross several rivers by double syphons, and skirt the edges of mountains above Pescia, Pistoia, Prato and Sesto to S. Silvestro, above Florence, 212 mètres above sea level, where a reservoir to contain 40,000 cubic mètres would be built. Total length, 103,245 mètres, at an estimated cost of 18,000,000 lire. The sanitary reforms that will be the logical sequence of these improvements in the water-supply, which will carry water not only to the town but to the villas on the hills in its vicinity, will render Florence more attractive than ever, and will doubtless reduce the already diminishing death-rate.

BUILDING REGULATIONS IN LEEDS.

A DEPUTATION from the Leeds Building Trades' Exchange and the Leeds and District Property-owners' Association interviewed the Streets and Sewerage Committee with reference to certain provisions in the new Consolidation Bill. The first question touched upon was the width of streets. The Bill provides that the minimum width shall be 14 yards. The deputation proposed as an alternative that the street should be 16 yards from wall to wall, but that they should be allowed to leave two yards of garden space on either side of the street, thus limiting the paving line to 12 yards. It was pointed out that while this would reduce the cost of paving and flagging, it would in reality give a wider thoroughfare and more space for ventilation. With reference to the clause which provides that at the intersection of all streets there shall be a radius of not less than 20 feet, the deputation urged that this was impracticable, and was informed by the committee that the provision would be expunged. The next question discussed had reference to the regulation of the Building Clauses Committee which requires a street to be filled up and levelled before the main drain can be laid, or before building operations can be proceeded with. One result of this, according to the spokesman of the deputation, is that after carting soil for the purpose of levelling up a street, builders would have to cart away the soil which was obtained from the excavations carried out in connection with the buildings, and might otherwise be used for the purpose of levelling the street.

They, therefore, asked that the prohibition of the committee should not extend to the erection of any building up to the basement floor, or to any building below the intended level of the street; and further, that the builder should be allowed to put down the main sewer if three feet of covering over the pipes existed or was provided, and to put in the kerbs and gullies after the street was levelled up. The latter arrangement, it was explained, would prevent gullies being placed opposite the doors of the dwellings. The time for appeal against a notice of the Corporation to pave and flag is at present four months. The new Bill proposes to make it seven days, and the deputation asked that it should be made three months. The committee agreed to extend the period to two months. It is also proposed in the new Bill to throw the expense of renumbering of streets on to the owner of the property, and the deputation asked the committee to reconsider the proposal. Another clause gives the Corporation power to remove projections into streets, and only allows compensation for those which have existed since 1824. The deputation asked that compensation should be allowed for all projections which are removed if they have existed for twenty years and upwards. The committee replied that they were already enabled, under common law, to act as was proposed, both with reference to the numbering and renumbering of streets and the removal of projections. They promised to give the other points brought forward by the deputation, and not disposed of, their careful consideration.

REGISTRATION OF PLUMBERS.

A CONFERENCE of Sanitary Authorities of Great Britain and Ireland has just been held at the Mansion House, London, under the presidency of the Lord Mayor. Delegates attended in considerable numbers from various parts of England, Scotland and Ireland. Those present from Scotland included Dr. Littlejohn, medical officer of health, Edinburgh, and president-elect of the British Institute of Public Health; Dr. J. B. Russell, medical officer of health, Glasgow; Dr. Eben. Duncan and Mr. D. M. Alexander, president and secretary of the Sanitary Association of Scotland; Dr. Farquharson, M.P.; Councillor Crawford, chairman of the Committee of Public Health of Glasgow; and Councillor Dick, chairman of the Hospitals Committee of the Town Council of Glasgow. During a short interval of absence of the Lord Mayor, Councillor Crawford presided.

Dr. Littlejohn, Edinburgh, complimented Mr. Crawford, as

chairman of the Public Health Committee of Glasgow, on the important services which he had rendered to sanitation in Glasgow, and said no better chairman, in the temporary absence of the Lord Mayor, could have been found than Mr. Crawford. He had always regarded the sanitary inspector as the right-hand of the medical officer of health. What they had met there that day to do was to do their best to see that this right-hand man was not only an intelligent man, but a thoroughly-trained man, secured by examination, and testified to by diploma.

The following resolutions were passed by the conference :—

"That this conference of delegated representatives of the sanitary authorities of Great Britain and Ireland, held at the Mansion House, London, February 18, 1893, having considered the provision of the Public Health (London) Act, 1891, requiring that every sanitary inspector appointed after 1895, except in the case of those specified therein, 'shall be holder of a certificate showing that he has by examination shown himself competent for such office,' is of opinion (1) that this new enactment is calculated to afford an important additional safeguard to the public health; (2) that it should be extended to the Health Acts applicable to the United Kingdom generally; (3) that a central board of examiners should be formed to conduct the necessary examinations and grant certificates in connection therewith; and (4) that the constitution of the board of examiners should be subject to the approval of the Local Government Board in England and Wales, the Local Government Board in Ireland for Ireland, and the Board of Supervision in Scotland." "That this congress of delegates, representatives of the sanitary authorities of Great Britain and Ireland, held at the Mansion House on February 18, 1893, is desirous of recording its opinion that the systematic training, examination and registration of plumbers is essential to the protection of the public health, and that a statement embodying this opinion should be presented as a memorial to Parliament, coupled with the expression of the further opinion that the Plumbers' Registration Bill, now before Parliament, should be passed into law at the earliest opportunity in the interest of the public health." "That it should be compulsory on local authorities, either separately or in conjunction with neighbouring health authorities, to provide such accommodation for isolation and treatment of infectious diseases as shall be satisfactory to the central health authorities, the Local Government Board in England and Wales, the Local Government Board for Ireland in Ireland, and the Board of Supervision in Scotland." "That with the

view of carrying out the resolution with greater efficiency, power should be given to the authorities herein described compulsorily to acquire the necessary sites." "That copies of the several resolutions passed at this conference of delegated representatives of the sanitary authorities of Great Britain and Ireland shall be embodied in suitable form for transmission to the various Departments of State dealing with public health matters, and also to the chairmen of the various sanitary authorities in Great Britain and Ireland, under the signature of the Lord Mayor of London as president of the conference."

SICK FUNDS FOR BUILDING WORKMEN.

A CASE which was heard before Mr. Shiel at the Westminster Police Court, on Tuesday, should be taken as a warning by builders and other contractors who are eager to aid their workmen when in illness or in other difficulties. Messrs. Castle & Sons, of Millbank, were summoned by a labourer who had been in their employment for a breach of the Truck Act. When the case was first before the magistrate the complainant stated that when he entered the defendants' service as a mason's labourer there was no stipulation about deduction from his wages. The defendants deducted 6d. a week from his pay as a subscription on his part to the sickness and accident fund which they had established for their men. Another workman, however, swore that no deduction was made by the firm, that the fund was formed and conducted by the men, that they were paid in full, and that the weekly subscription was voluntarily made by the men, though the pay clerk received the money.

The pay clerk said that he paid all the men weekly, according to the number of hours worked, without deductions. He afterwards, by the wish of the men, took 6d. from each man's wages for the sick fund. He handed the 6d. to the secretary of the fund, who was one of the workmen and was elected by the workmen. The firm had nothing to do with the fund. Each workman had a numbered box in which his wages were placed. Witness took 6d. from each box for the club before the workmen took their wages. Practically the deduction was made before the men saw their money, but it was made by their wish. The complainant had tacitly agreed to the system by making no complaint during the five years he had been in the employ of the firm.

An office messenger in the service of the defendants deposed that he had been a member of the sick club since its formation, and was now secretary. It was started by the men.

MERRYWEATHERS'

"COMPACT" FIRE HYDRANTS.

AS USED AT THE HOTEL METROPOLE (LONDON AND BRIGHTON), ALBERT PALACE, &c.

The "COMPACT" has following advantages:—

- 1.—It is a perfect Hydrant without packing.
- 2.—It takes up least possible space.
- 3.—It has large clear waterway.
- 4.—It is all gunmetal, and can be had with screwed or instantaneous outlet, and screwed or flanged inlet.

OPEN FIRE-PLACE

MANCHESTER STOVE

Made in various Designs and Sizes, with Tiled or Iron Sides, Single or Double Fronted, and with Ascending or Descending Smoke Flue.

Very largely used in HOSPITAL WARDS, for which the down-draught arrangement, as now shown, is specially suited.

New Illustrated Catalogue Free on Application.

E. H. SHORLAND,
WARMING AND VENTILATING ENGINEER,
Contractor to Her Majesty's Government, the Bank of England, &c., &c.,
St. Gabriel's Works, Erskine Street,
MANCHESTER.

Shorland's Inlet and Outlet Ventilator in every Design.

The deducted 6d. was divided, 4d. being the subscription to a sick fund and 2d. to an accident fund. The accident fund was administered by the firm, which had to make up constant deficits, the fund being unequal to the claims upon it.

Mr. Sheil: Are the men obliged to belong to the club?

Witness: Well, they are supposed to belong to it.

Mr. Sheil: Then I think that brings it within the Truck Act.

Mr. Castle: They are not obliged. It is mentioned to them that there is a club, but a man would not be refused employment if he refused to join. There are twelve men in the service of the firm who do not belong to the club.

Mr. Sheil said that if the men were paid in full, or if the pay clerk was their agent and was paid in full, it did not matter what they might afterwards voluntarily do with the money. The question therefore was whether this was a deduction by the pay clerk as the agent of the employer or a payment by the pay clerk as the agent of the men. Mr. Sheil then recalled the secretary, and asked whether he had any minute or resolution of the appointment of the pay clerk to deduct the 6d. on the men's behalf.

The witness admitted that there had been no formal appointment. He said it had been the general wish that the pay clerk should receive the sixpences because that was the most convenient course.

Mr. Sheil: Then I do not think it can be made out that he was the men's agent, and I must impose a fine of 1s. and 2s. costs.

It was pointed out that the 9th section of the Act authorised a fine of 10l. on first conviction.

Mr. Sheil: Of course, if the law is broken again it will be quite a different thing.

THE USE OF STEEL FOR CONSTRUCTIVE PURPOSES.*

(Concluded from last week.)

Roof over Hengler's Circus, Argyle Street, London.

Mr. C. J. Phipps, Architect.

This was constructed wholly of steel in the year 1883. It is conical in section and is supported on 16 columns, the centres of these being 82 feet 4 inches apart. In plan it is a polygon of 16 sides. There are 16 braced ribs supported on 16 lattice girders 10 feet deep, forming the sides of the polygon.

* A paper read by Mr. Richard Moreland, M.Inst.C.E., M.Inst.M.E., at a meeting of the Society of Architects.

There is a central cylinder of steel, 6 feet diameter inside and 13 feet 6 inches in length, with flanges top and bottom to which the upper and lower members of each of the lattice girders are connected.

The columns are 10 inches in diameter, $1\frac{1}{4}$ metal, 2 feet 6 inches square bases, a total height of 28 feet 6 inches. Brackets 3 feet in length are constructed at a height of 18 feet 6 inches, and these form support to the floors and galleries, and the construction of these tend to give the column additional lateral support. The ends of the lattice girders rest on tops of columns, these are 16 feet long, 10 feet deep, the flanges made of 5 by 5 by $\frac{1}{2}$ T steel with a 10 by $\frac{1}{2}$ rivetted on the label of the T. There are two sets of bracing dividing the girders into two parts, the struts are 4 by 3 by $\frac{1}{2}$ T steel and ties 4 by $\frac{1}{2}$ flat steel. An additional tie at each end is placed to divide the lower flange into four divisions, to support timbering and girders for roof which is supported by it. The ends of the girders have end plates set at an angle to fit the polygon, and these are securely jointed and bolted together as well as to the caps of the columns, and so form an effectual tie and support for the main braces of the roof. The lattice girders serve to support an external construction forming portion of the structure, and spaces between the lattices are used for window openings. On the top and over each column is fixed the braced steel roof ribs. These are 43 feet 6 inches long, 13 feet 3 inches deep at cylinder at centre, and 1 foot 6 inches deep at ends.

The flanges are of T steel section 5 by 5 by $\frac{1}{2}$ of Butterley steel rolled in one length. The lower flange is curved and is so constructed as to produce a rise of 8 feet from the top of lattice girders to the underside of centre cylinder. The braces are of 4 by 3 by $\frac{1}{2}$ T steel, and 4 by $\frac{1}{2}$ flat buds alternating, with the exception of the three last at the column ends, the last or the first brace over the column being formed of 24 by 4 by $\frac{1}{2}$ steel angles. The ends 13'3" deep, fit and are securely jointed and erected to the upper and lower flange of the cylinder, 6'0" diameter of $\frac{1}{4}$ -inch steel plate with 6 by 6 by $\frac{1}{2}$ steel angles, and 9 by $\frac{1}{2}$ bent to a circle. The roof was constructed to support slates, and the lower flanges of braced ribs supported the construction of the ceiling. The cylinder in centre was used as a ventilator of a sun burner and for the building. The ring of lattice girders connected together form an effectual resistance to the thrust of the roof ribs, although the roof ribs, connected to the cylinder as they are, form a sufficiently rigid structure by themselves to support the roof and ceiling, and their own

WORKS, ROTHERHAM. Estab. 1854.

weight, but the element of the tie at the base of the roof braces adds very considerably to the strength and stability of the structure. The mode of construction suggested at once the method of erection, and this was done in a very simple way. The top of the cylinder being 60 feet from the ground, an 80-foot derrick pole, 15 inches square, was set up inside the cylinder, which was set up on end on the ground, the derrick being properly bedded and guyed with its lifting tackle on the top.

The columns and lattice girders being previously erected by a smaller derrick, the cylinder was then hoisted into position and fixed securely by cross timbers fixed under it and on the derrick. The roof ribs were then hoisted into their position one by one by another derrick, and secured to the cylinder and ring of lattice girders, and when they were all hoisted and adjusted into position, they were all securely rivetted in position, the 80-foot derrick was cut and lowered out of the cylinder and the roof left in position. When the support of the derrick was removed, the actual deflection of the cylinder and roof ribs did not exceed one quarter of an inch.

This form of roof naturally recommends itself for its simple method of construction and ease and quickness of erection, as no scaffolding is employed in the ordinary sense of the word, as well as for lightness of scantlings and economy of construction.

Roof over the Victoria Concert Hall, Langham Place,

Under the direction of Messrs. T. E. Knightley and
C. J. Phipps, Architects.

This roof is constructed entirely of steel of mild quality, ultimate breaking strain per square inch 28 to 30 tons. It is to cover the hall 90'0" span and 115 feet in length, one end curved to an arc of a circle and the other with curved ends at the corners. Two main principals are thrown across the hall 38 feet apart, which rest on four cast-iron H-shaped stanchions 12 by 12 and 25'0" long and resting on bed-stones 3'0" long, 2'0" wide, 12 inches thick. These were erected before the wall was built, and when built it was carried up embedding them in the structure. Three intermediate principals are fixed at equal distances between and parallel to the main ones, and these are supported on short C. I. stanchions 6'6" long, which rest on a steel girder supported by the 25 feet stanchions supporting the main principals. The two main principals are intersected in their centre by two cylinders 8'0" internal diameter, 12'6" deep, of 5-16th steel plate, with steel angles and concentric flange plates top and bottom. These were intended to be used for the purpose of ventilating the

building and for the gas-burners, but they serve an important purpose in the structure, as their flanges are utilised for the purpose of connecting the radial roof ribs, thirteen at one end and eleven at the other, and supporting and connecting the end areas of the roof.

The three intermediate principals are connected to the two cylinders by transverse bracing, which enables the radial ribs to throw and transmit their stresses from end to end of the roof longitudinally by means of this cross bracing. The two main and the three intermediate principals are 90 feet from the centres of the supporting stanchions; they have a rise of 4 feet 9 inches from their support, and have a depth of 12 feet 6 inches, and are flat at the top for a length of 28 feet 3 inches.

The top member of the main principals were of 4 by 4 by $\frac{1}{2}$ angle steel, with 12 by $\frac{1}{2}$ plate as a web rivetted between them. The lower member of angle 12 by $\frac{3}{8}$ plates, the projection of the plates beyond the angle, serve the purpose of connection to the cross bracing. The thirteen radial ribs are 41 feet in length and 12 feet 6 inches deep, top and bottom members of 4 by 4 by $\frac{1}{2}$ T steel, with angles for the cross bracing. The eleven radial ribs were 32 feet long, of 4 by 4 by $\frac{3}{8}$ T steel and angles for cross bracing. The intermediate cross bracing between the cylinders were 5 by 5 by $\frac{1}{2}$ T steel with angles for bracing. The thirteen radials were fixed on short stanchions 6 feet 6 inches long, and, in consequence of the importance of not stopping light, a device had to be adopted by making a curved structure at the edge of the roof, which had the effect of keeping the roof apparently low down.

The erection of the roof was carried out in a simple manner. The cylinders were set up on end in position on the ground, and a derrick 16 inches square of fir timber 100 feet long, well bedded on the ground, was fixed inside the cylinder. The tackle was fixed on the top and the cylinder lifted to its position. A second derrick hoisted the half main principals in detail, and the intermediate principals were hoisted in one length previously to the cylinder, so that the fixing and lifting of the radials became an easy matter. The whole was pulled together securely, and when the derrick was removed from either cylinder the deflection which occurred was not more than $\frac{1}{4}$ to $\frac{1}{8}$ th of an inch. The roof supports a heavy lead flat and slabs, and heavy timbering and a heavy ceiling.

Steel Cantilevers for Balconies at Victoria Concert Hall.

Actual projections from wall supporting construction in concrete, and calculated to carry a load of 2 cwt. per super foot, including weight of construction.

Tender for Contracts for any Joiners' Work or Ornamental Plaster. Painting—Plain or Decorative.
Wrought-Iron Work. Stained Cathedral Glass, and any other Interior Work.

The total length of levers is 22'0, 25'0 and 28'0. The longest lever is 19'0 from fulcrum to end, and 9'0 from fulcrum to wall. The shorter ones are 14'0 from fulcrum to end, and 8'0 from it to wall. They are held down by bolts anchored to the footings, as the superincumbent weight was not sufficient counteraction to withstand to calculated stake and moving load on the levers. The levers are 1'9 deep at the butt end, and taper down to the unsupported end; at this a rolled girder is introduced to project and serve as floor and ceiling support. The webs were 21 inches by 5-16th, and the flanges of steel angles 4 by 4 by $\frac{1}{2}$, 5 by 4 by 9-16th, and 6 by 4 by $\frac{3}{8}$. Cross joists are even and connected, and the whole is immersed in concrete.

Battersea Polytechnic. Roof over Swimming-baths.

Mr. E. W. Mountford, Architect.

39 feet 3 inches span rise of roof, equal to half the span. Rafters of 5 by 3 steel joists. Principals, 10 feet apart.

Silver & Fleming, Wood Street. Roof over Warehouse.

Messrs. Ford & Hesketh, Architects.

21 feet 10 inches span, made of plates and angles; webs $\frac{1}{4}$ thick, angles 3 by 3. The rib is semicircular on the inside. principal is fitted with a steel lantern frame.

Charlotteville Board School, Guildford.

Mr. W. G. Lower, Architect.

22 feet span, 13 feet 6 inch rise. Rafters of 8 by 4 steel joists. Tie beam, about midway between the feet and apex, also of 8 by 4 steel. As a relief a curved T is fitted between the tie beam and the feet of principal.

University College, Engineering Laboratory.

Professor Roger-Smith & Son, Architects.

Triangular roof principal, 50 feet span, 15 feet rise, rafters of 6 by 3 steel joists. Principals 11 feet apart.

Examples of Steel Stanchions for Warehouse to Carry Six Floors.

The total load on the bottom stanchion is 150 tons. The stanchion is continuous in all cases for two floors, the sectional area being proportioned to the load at each floor by the upper half of the stanchion being made with a plate less than the lower half. The basement to ground-floor stanchion is of box section, formed of two 10-inch steel channels, with two 14-inch steel plates rivetted to each side for basement length, and one 14-inch plate for ground-floor length. The first to second floor

stanchion is of H section, and is made of an 8 by 6 joist, with two plates rivetted to each side for first floor, and one plate each side for the second floor. The upper stanchions are of similar construction, but proportioned to the loads they have to carry. This form of construction is more economical than cast-iron columns and stanchions. The form offers special facilities for forming good connections. The weight is greatly diminished, and the cost of fixing and transport is of course proportionately reduced.

A Braced Girder, 56'0 long, 10'0 deep, of Rolled Sections.

This was erected 400 from the ground above an existing building, the ends being supported by columns attached to existing girders in building. The girder supports the weight of half a three-storeyed building erected on it, and an adjoining wall. The girder is calculated to support an equally distributed load of 125 tons. The girder is double, and is built with the rolled sections side by side, the upper member having a 14-inch plate on upper flanges. The lower member is 2'12 by 6, the bracing at ends and upper member 14 by 6. The structure of the girder is light, and the position in which it was built was the reason for the adoption of the design, as each of the component parts are easily handled, and the whole was bolted together in position. No deflection occurred with its load. It was fixed at the Tivoli, Strand, under the direction of Mr. C. J. Phipps.

Seven-arched Steel Roof Principals, 53'6 span, 36'6 height.

Messrs. A. L. Watkins & Sons, Architects.

These were fixed for the New Market, Newport, Monmouthshire. They rise vertically 10'6, and then are arched to a radius of 26'0. The width of ribs 1'6 at base, and 2'6 at the crown of the arch. Both the top and bottom members are alike of 2'4 by 4 by 7-16 angle section, and 10 by 7-16 on face of the angles, both sides the full extent of the rib. The vertical rise has a plate $\frac{1}{4}$ -inch thick connecting the members, and beyond lattice-bars 4 by 2 by $\frac{1}{2}$ intersecting 8 pantines 20'0 long 8 by 3. The sections of the arched ribs were completely rivetted together on the ground, and then raised into position by a derrick pole and tackle. A light scaffold was erected on the members of the ribs, and so the roof was erected and constructed with scaffolding of a small cost.

ELEVENTH ANNUAL
BUILDING EXHIBITION

Of all Industries connected with the
Building Trades,

MARCH 11 to 25, 1893.

"THE ARCHITECT" says of the 1892 Exhibi-
tion:—

The representatives of all industries connected with the
building trades will be wise to commence at once their pre-
parations for the Exhibition. There cannot be as loud a pre-
liminary flourish about an Exhibition in Islington as there is
always about one of those designated as "international";
but if exhibitors will consider the results of the two classes,
they will discover that in the former they have met men of
business and received orders, while for the privilege of par-
ticipating in the universal shows they have not only lost
large sums, but discovered that the *dilettanti* and holiday
makers, who constitute the mass of visitors, are not fasci-
nated by the best aids to construction."

JOHN BLACK, Secretary.

Exhibition Offices: 2 Newcastle Street, Strand.

THE DENSMORE. THE WORLD'S GREATEST TYPEWRITER.

TO ARCHITECTS.—If you have come to the conclusion that the use of a Typewriter for writing your Specifications and Contracts will SAVE YOU TIME AND MONEY, give the DENSMORE a thirty days' trial before purchasing any other.

The Machine may then be returned if not found satisfactory in every respect, and a decided advance in typewriting mechanics.

If you decide to purchase it, we guarantee it free from all mechanical defects, and keep it in order for two years free of any charge.

TWO CARRIAGES, fitted with SOFT and HARD CYLINDERS, which are instantly INTERCHANGEABLE, are furnished with each Machine without extra charge—thus one DENSMORE performs the work of two ordinary machines.

NO LIFTING OF CARRIAGES REQUIRED IN ORDER TO SEE YOUR WORK.

If you require anything in Typewriting Supplies, give us a call and look over our stock. We have seventy-five different grades of Typewriting Papers and a large stock of the best Carbon Papers. Typewriting of all kinds neatly and promptly executed by a corps of skilled operators.

The Densmore Typewriter Co., Ltd.

TRADE NOTES.

THE extensive buildings of the new Workhouse Infirmary, Liverpool, are being erected from the plans and under the superintendence of Mr. C. H. Lancaster, architect, of Liverpool, for the guardians of the poor of the city of Liverpool. Each pavilion is four storeys high, the wards in the same being 110 feet by 24 feet. The whole of the wards are being warmed by Mr. E. H. Shorland, of Manchester, by means of his patent open fireplace Manchester stoves, with descending smoke-flues, which arrangement is now being largely adopted in hospital wards. There are two stoves in each ward, some forty stoves being used in all.

IN continuation of the additions and enrichment of the interior of St. Cuthbert's Church, Philbeach Gardens, S.W., Messrs. Jones & Willis, who executed the carved priests' stalls last year, have now in hand a fine oak rood-screen, which it is expected will be completed in a few months. The columns supporting the beams are surmounted by richly-carved figures under traceried canopies, the sides of screen proper are worked out with traceried panels and carved cresting, the immediate centre being carried up to a considerable height, and finished by a representation of the Crucifixion of our Lord, the central figure being more than life-size. The whole of the work is being executed from the drawings and under the superintendence of the architects, Messrs. Gough & Roberts, Carlton Chambers, Regent Street.

THE important and ancient manufacturing village of Birstall, near Leeds, has just witnessed an interesting ceremony. The fine old church was filled to hear a short service from the vicar, the Rev. John Kemp, M.A. Afterwards Miss Taylor, daughter of the vicar of Gomersal, set the fine new clock in motion, with Cambridge chimes, and showing the time on two external dials. A dampness was thrown over the proceedings owing to the death of the chief contributor a few days previous, Mrs. Battye, wife of the chairman, and grandmother of the young lady who started the clock. The ringers

rang muffled peals during the afternoon and evening. Birstall indeed is noted for its fine bells and good bell-ringers. The clock and chimes were made and fixed by Messrs. Wm. Potts & Sons, clock manufacturers, of Guildford Street, Leeds, who also lately fixed a fine clock at Catterick Church, North Yorkshire.

THE Ellon District County Council Committee have accepted the offer of Mr. Scroggie, Kinharrochie, to bridge the Ythan at a cost of 1,260*l*.

THE contract for work at Thame Church on the south aisle and porch has been accepted from Messrs. Wells & Son, contractors, at 544*l*. 4*s*.

At a meeting lately held the Hospital Sub-Committee of the Leeds Corporation Sanitary Committee decided to advertise for tenders for the furnishing of the portion recently added to the hospital at Manston Hall.

SIX tenders have been received by the Shrewsbury Town Council for the erection of the proposed public baths between the Quarry Grounds and Teece's Lane. The highest tender was 9,514*l*. 11*s*. 4*d*.; and the lowest, that of Mr. Henry Farmer, builder, Shrewsbury, 7,145*l*. 12*s*., was accepted.

At the meeting of the Coventry City Council, on the recommendation of the Baths Committee, it was decided that the new swimming-baths should be lined with asphalt in lieu of Portland cement, at an extra cost of 240*l*., and to accept the tender of the Coventry Gasfittings Company, Limited, for 1,390*l*. for engineers' work in connection with the hot and cold water supplies and heating apparatus.

ON Wednesday last the Mincing Lane Safe Deposit was ceremoniously opened to the public, on which occasion Mr. S. Studd, the managing director of Milner's Safe Company, Limited, was present, as well as Mr. F. Wells, the manager, who explained in a lucid manner the formidable intricacies of the emporium, which is henceforth destined to guard the treasures of the London commercial sale rooms' frequenters and City magnates in general. The establishment is one which is calculated, both from a constructional as well as an artistic point of view, to attract much attention and patronage.

WE hear that Rendle's patent "Invincible" glazing has been selected by the Great Eastern Railway for the roofs of the extension of Liverpool Street Terminus, London. The area of the glazing amounts to about 100,000 feet superficial. The same system has also been selected by the architect for the skylights over the National Portrait Gallery, Trafalgar Square.

In each case the glass is laid in copper bars, and is the latest improved system of Messrs. W. E. Rendle & Co.

THE name of the firm given in the list of tenders last week for painting, &c., at the South Western Hospital should have appeared as "Jenrick & Crocker."

VARIETIES.

THE Water Committee of the Liverpool Corporation being anxious to give employment to workmen in the district, have instructed the engineer to obtain tenders for iron piles for additional works required. The completion of the city main pipe lines will involve an expenditure of 80,000*l*. The works are to be expedited as much as possible.

THE *Leeds Mercury* (February 28) says:—At a meeting of the Leeds streets and sewerage committee held yesterday, it was agreed to apply to have a clause inserted in the new Consolidation Bill empowering the Corporation to provide 210,000*l*. for various sewage works. It was also agreed to purchase two houses in Willow Terrace Road for the purpose of a street improvement, at a cost of 1,130*l*.; 3,000 square yards of land from Mr. Archer for the improvement of Harehills Lane; and 208 square yards of land from Dr. Clayton for the improvement of Gledhow Lane.

AN inquiry has been held at Knaresborough into an application by the local authorities to borrow 7,000*l*. for the establishment of a sewerage system, by the intermittent land filtration process.

At the meeting in Birmingham of the reception committee of the Church Congress, authority was given for securing Bingley Hall, which is to be fitted up for the larger meetings at a cost of about 1,000*l*. The Town Hall and Midland Institute Theatre are to be secured for sectional meetings, and it is hoped the old post-office building will be available as a reception-room.

MR. CAMPBELL BANNERMAN has stated that, so far as possible in army contracts for building work in Ireland, Irish materials were used, but it was found that Welsh slates were lighter and more durable than Killaloe slates, and therefore cheaper in the end. Consequently, the contracts for work at the Curragh, so far as entered into, had included Bangor slates. If, however, Killaloe slates could be supplied of equal quality with the Bangor slates, and not higher in price, there would be no objection to use them in any further contracts.

BUILDING AND BUILDERS.

AT the meeting of the London County Council the Fire Brigade Committee recommended that the Council should purchase from the Corporation of London, for the sum of 16,000*l.*, the site fronting John Carpenter Street, to erect a fire station; also for the erection of a Shoreditch fire station in substitution to the existing one in Old Street, by the purchase of land fronting Tabernacle Square.

THE Gas and Lighting Committee of the St. Helens Corporation have approved of plans of new tar-distilling works to be erected at the present gasworks.

A NEW bonded warehouse, the plans of which have been approved by the Board of Inland Revenue, is about to be erected in Arbroath by a number of the local wine and spirit and tobacco merchants. It is to be built in West Newgate Street, on the site of an old brewery.

AT the meeting of the Dean of Guild Court, Glasgow, the Police Commissioners received authority to proceed with the erection of the new police offices for the southern district in Oxford Street and Nicholson Street; and the Corporation were authorised to erect buildings in Pollokshaws Road for stables, workshops and offices in connection with their taking over of the tramway system.

AT the meeting of the Gloucester City Council it was reported that the negotiations for transforming the Corn Exchange into the Central Post Office had ended satisfactorily, but regret was expressed that it would be necessary to take out the present front, and bring the building level with the street.

ELECTRICAL.

AN inquiry has been held by the Local Government Board at Blackburn into an application of the Town Council to borrow 50,000*l.* for electric lighting purposes. The Council recently issued a circular asking tradesmen if they would use electric lighting if introduced, and the response was so unanimous that the Council decided to proceed at once.

PLANS of buildings to be erected in Cotton Street, and adjoining the Gasworks, which are to contain the plant of the electric lighting scheme promoted by the Aberdeen Corporation, have been approved by the Plans Committee of the Town Council. The buildings will cost 3,500*l.*

THE installation for lighting several of the principal streets of Glasgow has been inaugurated by Lord Provost Bell. Lord Kelvin, at the luncheon which followed, said he hoped that the installation would be extended till the whole of Greater Glasgow was so illuminated. In that way they might secure for Glasgow what had been arrived at in New York—a prodigious diminution of crime.

A LECTURE was delivered by Dr. E. Hopkinson on "Electrical Railways" at the Royal Institution. A comparison he made between electric and steam traction showed the cost to be the same in both cases. Lines, he said, were being projected on which trains will travel at 150 and 200 miles an hour.

TENDERS FOR THE NEW LOCH KATRINE AQUEDUCT.

AT a recent meeting of the Glasgow Town Council the Sub-Committee of the Water Trust Works recommended that the offer of Messrs. Morrison & Mason, Limited, for the construction of the Black Rig section of the new Loch Katrine aqueduct be accepted. The amount of the tender was 86,582*l.* 14*s.* 3*d.*

Mr. Starke said he understood that there were a number of tenders for this work, and that there was one of them 7,000*l.* or 8,000*l.* lower.

Mr. Waddell said the tenders varied from 79,000*l.* to 93,000*l.* The committee had thought it judicious to send the four lowest tenders to the sub-conveners, along with the convener of the General Committee and the sub-convener. These tenders were gone over very carefully along with the engineer. They then made inquiries with respect to the position of the parties, and took notes of the prices of various articles connected with the contracts. They found in the tenders which were lower than that of Messrs. Morrison & Mason prices put in for certain things which the engineer stated could never enable the parties to finish the work. When these prices were compared with those of the three contractors who were at present doing work for them, they found that the objections of the engineer were borne out. Taking these matters into consideration they were convinced that there was something wrong with the lower offers. Not content with that, they further took into consideration the whole bearings of the case, and having regard to the fact that the contract would extend over four years, it was thought that it would be a very serious matter indeed if the contractors, as had been the case in one or two instances

before, should break down, and not be able to go through with the work. The committee also had regard to the necessity for providing a larger supply of water as speedily as possible, and to the demands in this respect, not only of the city but of districts outside. The two lower offers were 79,791*l.* and 84,602*l.* The Water Committee, in recommending the offer of Messrs. Morrison & Mason were unanimous. When the members of the committee themselves were unanimously satisfied that they were doing what was right in the interests of the citizens and of contracting work generally, he thought the Council should approve of their recommendations as far as they possibly could. Already, in consequence of taking the lowest estimate, the work had cost at least from 20,000*l.* or 30,000*l.* more than it would have done had the Corporation taken the estimate before the lowest one.

Mr. J. W. Dick said that in specifications for contracts it was always found that there was a difference in the prices quoted by various contractors. Therefore he did not see why in the present instance a point should be made of the varying prices of the materials required. He was led to believe on the very best authority that no fault could be found with the firm who had sent in the lowest offer, or that there was any doubt about their ability to complete the contract as expeditiously and as well as Messrs. Morrison & Mason. It seemed to him that in proposing to give the work to Messrs. Morrison & Mason they were strengthening the feeling which was current outside the Council, that they existed as a body to a very large extent for the benefit of that firm.

Mr. King said the reasons which influenced the committee could not very well be stated in detail, but surely sufficient confidence could be reposed in the members to cause the Council to believe that the reasons were adequate. Their decision had only been come to after long consideration, and but for the fact that they were hemmed in to accept the lowest tender, they would not have made the recommendation that they had done.

Mr. Battersby said that on asking the committee to inform him why the lowest offer had not been accepted he had been informed that in one instance there was not sufficient caution that the work would be completed in the necessary time. He had, therefore, been satisfied, from his limited experience, that the offer in the circumstances could not be accepted. With regard to another of the offers, the committee were satisfied that the prices quoted for materials were below the market rate, which, in all probability, would have led to the result Mr.

Waddell had indicated. He was opposed to accepting the cheapest contract simply because it was the cheapest. They had had experience in connection with another committee from which it was apparent that the lowest offerer, as shown by himself, had lost no less than 18,000*l.* Further than that, he had been informed that at the time the contract was accepted it was known that the estimate was really below the price at which it was possible to do the work. Another point in connection with the present contract was that the two lowest offerers had not had experience which made it judicious that their contracts should be accepted.

Mr. Ure said that in a case such as that under consideration, where delicate explanations could not be given at a public meeting, he thought they were justified in accepting the unanimous recommendation of a committee of twenty-seven members.

Mr. Campbell said he thought even a unanimous decision of a committee ought to be carefully scrutinised; but he supported the recommendation on other grounds. This Black Rig section of the aqueduct formed a small but very important part of a general scheme. It was therefore not only desirable but imperative that the most competent contractors available should be selected.

Mr. Starke said that personally he was satisfied to accept the unanimous recommendation of the committee, but a good deal of comment was being made outside, and he thought it his duty to bring it before the Council, that the reasons for accepting the contract might be made public.

The minute was then approved.

THE M'EWAN HALL, EDINBURGH.

THE members of the Edinburgh Architectural Association a few days ago visited the M'Ewan Hall, where they were received by Dr. Anderson, who showed the party over the building from basement to summit. He explained that he had adopted the form of the Greek theatre, believing that to be the best form for the auditorium. There were two galleries both alike, the one above the other, and the building was capable of holding three thousand people. The arrangement of the staircases was such that the occupants of the two galleries never came together, and there were a good many entrances and exits. A large skylight and a series of windows close to the roof furnished the principal means of lighting the building,

and the air was to be heated by passing over a steam coil. There was a great outer wall, and an inner wall of arches and pillars, the diameter of the building being 144 feet 6 inches. To roof such a building was rather a problem, and he had called in the assistance of Mr. Westland, of Messrs. Cunningham, Blyth & Westland, who had produced a very clever thing. It was composed of steel ribs, and to him appeared a very novel and complete production. It was to be hoped, too, that before long the great tower would be erected—a tower which would reach to about 280 feet in height. Behind the platform there was a gallery, where, he understood, there was to be erected a very fine organ. Arrangements were also being made so that an orchestra could be fitted up when wanted. This was entirely an afterthought, the hall not having been made for that purpose. After the building was commenced the professor of music came forward—he ought to have come before—and a makeshift had been resolved upon. Mr. Westland, at the request of the architect, described the construction of the roof. The whole structure of the roof, he said, was carried on twenty-two ribs, which had to be of peculiarly strong construction, because it was impossible to put in any tie-rods. The whole horizontal strain had to be borne by the bracing between the ribs. One awkward thing in connection with the bracing was that at the back of the stage the circle was not completed. If it had been a complete circle, the strains would have been easily calculated, but as the circle stopped the whole strain had to be carried across the stage by means of a very heavy steel girder, weighing about 6 tons. In order to prevent any horizontal thrust on the walls, every rib was set upon rollers, because on a roof of that size there would be considerable expansion and contraction with the changes of temperature. It might be as much as half an inch for the whole roof, and that would have created some movement of the wall. To prevent this, therefore, the girders rested upon rollers. Though it might seem rather an unsafe thing to set such a large roof upon rollers, the building, taken as a whole, could never move in the direction of any one roller, because the whole of the other rollers were preventing it from doing so. Therefore, although on rollers, it was really as strong as if it were bolted down or set upon bed-plates. It was made of the usual kind of steel of which bridges and such work was made, standing a strain of 26 to 30 tons to the square inch. The roof was calculated to stand a strain of from 5 to 5½ tons to the square inch. It was erected in a very ingenious way, a wooden stage being raised in the centre of the hall, and a circular crane employed which

travelled round the whole building, raising the ribs and setting them in their places whole. When completed the roof did not subside more than an eighth of an inch. At the close of the visit Mr. W. W. Robertson proposed a vote of thanks to Dr. Anderson, remarking that in the course of their examination of the building they had seen a great deal to admire, and a great deal to interest and instruct them. He spoke of the exceptional character of the building, and specially complimented Dr. Anderson on having imparted to it something of a monumental character worthy of the great university to which it belonged.

THE ECCLESIASTICAL COMMISSIONERS AND LEASEHOLDS.

THE Ecclesiastical Commissioners have for some time past had under their consideration the various questions which have been raised with reference to the present system of leasehold tenure in London and the suburbs, with the view of ascertaining how far it might be possible to secure to their lessees the benefits arising from expenditure made by them on the improvement of the property comprised in their leases. To do this without injury to the trust which Parliament has committed to the charge of the Commissioners has involved numerous difficulties. The Commissioners are of opinion that an equitable solution may be found in the extension of the term of the leases to 999 years (making them practically perpetual), at such an increase of rent as will compensate the Commissioners for the surrender of their reversionary interest in the property. The amount of this additional rent would be ascertained by a conversion of the present leasehold term into a perpetuity on the basis of the 3 per cent. tables.

The method proposed for adoption will be perhaps best understood from an examination of the following examples:—

Example A.—House and garden of net annual value of 100*l.*, held on lease for an unexpired term of 87 years at a ground-rent of 10*l.* per annum. The additional rent in this case would be 3*l.* 16*s.* 5*d.* per annum, *i.e.* the property would be held on lease for 999 years at a rent of 13*l.* 16*s.* 5*d.* per annum.

Example B.—House and garden of net annual value of 40*l.*, held for an unexpired term of 65 years at a ground-rent of 5*l.* per annum. The additional rent would be 2*l.* 15*s.* 7*d.* per annum, *i.e.* the property would be held on 999 years' lease at a rent of 7*l.* 15*s.* 7*d.* per annum.

JAMES HILL & CO., 100^A Queen Victoria St., London, E.C.

Example C.—House and garden of net annual value of 60*l.*, held on lease for an unexpired term of 85 years at a ground-rent of 7*l.* per annum. The additional rent would be 2*l.* 7*s.* per annum, *i.e.* the property would be held on 999 years' lease at a rent of 9*l.* 7*s.* per annum.

Example D.—House and garden of net annual value of 50*l.*, held on lease for an unexpired term of 90 years at a ground-rent of 10*l.* per annum. The additional rent would be 1*l.* 8*s.* per annum, *i.e.* the property would be held on 999 years' lease at a rent of 11*l.* 8*s.* per annum.

Example E.—House and garden of net annual value of 200*l.*, held on lease for an unexpired term of 95 years at a ground-rent of 30*l.* per annum. The additional rent would be 5*l.* 8*s.* 7*d.* per annum—*i.e.* the property would be held on 999 years' lease at a rent of 35*l.* 8*s.* 7*d.* per annum.

Example F.—House and garden of net annual value of 90*l.*, held on lease for an unexpired term of 75 years at a nominal ground-rent of 2*l.* per annum. The additional rent would be 5*l.* 13*s.* 3*d.* per annum—*i.e.* the property would be held on 999 years' lease at a rent of 7*l.* 13*s.* 3*d.* per annum.

The Commissioners are prepared to consider applications from lessees holding house property directly from them for unexpired terms of not less than 40 years.

The only expense to the lessee, where the property is not sub-leased or encumbered, will be a fixed fee of moderate amount for the surrender and the grant of the new lease, together with the amount payable for stamp duties.

By the foregoing arrangement, the lessee would secure the enjoyment of the property in perpetuity, and this improvement in the tenure would give his estate an enhanced value. He would have a strong incentive to keep the property continuously in substantial repair, since he would enjoy the whole advantage of his expenditure. He could borrow money on better terms on mortgage of his interest in the property. The landlord would be fairly compensated for the loss of his reversionary interest in the property. His rent would be better secured, since the property would be maintained in a better state of repair. He would avoid the loss which would result from having to invest the proceeds of sale at 2½ or 2¾ per cent. in the case of compulsory enfranchisement by Act of Parliament. The character of the estate would be maintained permanently to the advantage of lessor and lessee. The vexed question of dilapidations which arises at the end of short-term leases would be wholly avoided.

THE SITE FOR CHRIST'S HOSPITAL AT HORSHAM.

IN the House of Commons on Monday Mr. Bonsor, the member for Wimbledon, asked the Vice-President of the Committee of Council on Education whether 1,000 acres of dairy land in Sussex, 37 miles from London, have been contracted for as the site for the boarding schools for 700 boys, 350 girls and 120 infants of the future Christ's Hospital, which, by the scheme approved by Her Majesty, were to be built within a convenient distance from the City of London; whether the whole governing body of forty-three set up by the scheme approved of such location for a metropolitan foundation of three centuries' life in the City of London itself, and whether he would be good enough to give the reasons for such a choice. Mr. Thomas Ellis, in reply, said:—The Council of Almoners of Christ's Hospital, with the consent of the Charity Commissioners, have concluded the purchase of about 1,000 acres of land near Horsham on which their new schools are to be built. The Charity Commissioners have no knowledge whether any members of the governing body dissented from the purchase. The choice was that of a governing body eminently qualified to act for the best, and the Commissioners saw no ground for withholding their assent to it.

WIND BRACING IN HIGH BUILDINGS.*

THE principles that should be observed in designing metal structures are so generally well understood, and there is such a substantial agreement among engineers as to their application, that we may reasonably expect to find every important iron or steel frame building designed in accordance with them. The greatest bone of contention in this skeleton has long been the use of cast-iron, which has been in large measure abandoned as material for bridges, but which is still extensively, though decreasingly, used for columns in fireproof buildings. There is occasion for an equally vigorous discussion of the relative merits of hollow tile walls and iron or steel rods as vertical bracing in lofty structures. The sole dependence of some architects for lateral stability in their buildings is on the ordinary partitions, weakened for such a purpose, as most of them are, by doorways through them, while others introduce stout iron rods or braces.

* A paper read by Mr. Henry H. Quimby before the American Society of Engineers, and published in *Architecture and Building*.

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

PATENTED IN
England,
Belgium,
France,
Germany,
Italy.

PATENTED IN
Austria-
Hungary,
Denmark,
United
States
of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 28, 1886.
I have had some trials made with the **KALLKOLITH** during the past few weeks, the results of which are very satisfactory. The **KALLKOLITH** is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale.
J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.
We are pleased to tell you that the **KALLKOLITH** supplied to us has been fairly tried, and we find that it answers all that you claim for it.
CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40*s.*, packing included. Special terms to Wholesale Buyers and Shippers.

Address—E. STUTTARD, 88 ADELAIDE ROAD, BROCKLEY, LONDON, S.E.

There will be little question of the sufficiency of brick partitions if there be many of them, when the width of a building is a large proportion of, or is equal to, the exposed height, and the foundations are firm and unyielding or not subject to disturbance; but a building of great height, even with a good breadth, if on yielding bottom should be efficiently braced with elastic metal.

In the type of building mentioned the columns carry not only the floors and partitions, but the exterior walls, which a writer on the subject recently called "mere curtains to shield the interior." This idea of their utility is measurably correct if the metal structure is provided with efficient vertical bracing; but if, as in some cases, the bracing is omitted or inadequate, masonry of some sort must be depended upon for lateral stability. As each storey of the walls is supported on the girders of its own floor and carries no load from above, the walls are independent of the height of the building, and may be only 13 inches thick throughout.

An office building recently erected has seventeen storeys above the pavement, giving it a height of 200 feet, and is only 60 feet wide. The party walls, which are abundantly able to stiffen the building in the direction of its length (180 feet), are 18 inches thick, presumably because of municipal requirements intended to prevent the spread of fire and contemplating the support of joists. The rear wall and the walls of a 25-by-80-foot recess, or court, at one side are 13 inches thick, but are little more than window-frames because of the needed provision for light. The front from the third to the fifteenth floors is also brick, and has two bay windows, the walls of which are 13 inches thick, but, being bowed and of trifling width between the windows, they would offer very little resistance to a lateral force. The lower two and upper three storeys of the front are of stone and terra-cotta respectively. The vertical bracing consists solely of the interior partitions, which are 8 inches thick, built of hollow boxing tile with four webs each 9-16ths of an inch thick, giving a total net thickness of 2½ inches. At four points 40 feet apart these walls, in a space 17 feet wide, are continuous and without doors or other openings from the third floor to the roof, being apparently the main reliance for lateral stability, most, if not all, the other partitions being greatly weakened by passages and windows. The building towers above all its neighbours (the tallest in the vicinity being about six storeys high and one immediately adjoining only five storeys), a fact of moment in estimating the force of the wind.

In the same city, a few blocks away, is a building partially

completed, designed to have the same number of storeys as the one first mentioned, but with a width of about 150 feet. It has provision for vertical bracing in the shape of double 6-inch eye-bars and 15-inch heavy channel struts, contrasting very sharply with the other. In both buildings the columns of each tier abut against those of the lower tier, with an intervening plate which forms a seat for the floor girders. The tiers are bracketed together with angle iron or bent plate lugs, a detail that is sufficient to prevent lateral displacement, but, because of the elasticity of the bracket in bending, and the large ratio of height to base of column, contributes very little to the rigidity of the structure. This will be seen by computing the stiffness of the brackets and by considering that the workmanship is never so perfect that a number of columns could be piled up end to end, without fastening, like children's blocks, which fact indicates that as the columns are always necessarily plumbed—temporary adjustable braces being used if there are no permanent ones—the faces are not all in perfect bearing, more especially as the plates between them are not planed and are consequently somewhat uneven, a condition which presumes some initial bending in the brackets and consequent slight initial lateral strain on the bracing.

The action of the wind against the side of a building produces the effects of overturning and shear, both greatest at the highest point of external resistance, which is the roof of an adjoining building, if there be any, or otherwise the surface of the ground. The overturning or the lift on the windward side is likely always to be less than the resistance of dead weight, but the shear is liable to be overlooked, and is probably the immediate cause of the collapse of most of the buildings destroyed by wind. In the type of structure under consideration the shearing action tends to topple the columns and crush the partitions or rupture the bracing, all in one storey. The column fastenings described are not stiff enough to prevent a slight movement of the tops of the columns, which can be firmly held by the bracing alone. If this bracing is mortared work its cohesiveness is liable to be gradually destroyed by severe vibrations or many successive impacts of pressure; and if once its hold is loosened its deterioration will be rapid.

The wisdom of depending on these tile partitions in exposed buildings is doubtful. The crushing strength of the material as tested in small pieces or single bricks, while varying according to the composition of the clay or process of manufacture, in no reported case much exceeds 7,000 lbs. per square inch of net section. Inquiry of manufacturers has failed to elicit any

information as to the strength of a complete wall, and as these tiles are easily broken in handling and laying, they are far more liable to serious and destructive flaws than iron or steel, and consequently any "factor of safety" adopted for their use may, with more reason than in the case of structural iron, be called a "factor of ignorance."

What intensity of wind pressure it is proper to assume in designing a large and high structure is an important question. The forces which we have to deal with here are not, as in other departments, limited and known, and the practice must be to some extent empirical. The experiments of the Forth Bridge engineers, and also those made by builders of wind engines, show conclusively that the pressure per unit of surface is less over a large area than over a small one, and probably the ascertained proportion of decrease will fairly apply to the large surface exposed by a great building. But the many instances of extensive and not lofty brick and stone buildings blown down are warnings against a too liberal allowance here, for a downward current of air will be deflected by surrounding low roofs or ground and accumulate intensity. The writer remembers a case of the demolition of a window by wind near the ground, which occurred at a moment that he happened to be looking at the particular spot. The locality was such that the force of the wind might become, and doubtless was, concentrated.

We do know that the wind sometimes develops an energy which must be far beyond what has ever been measured, and the efforts of investigators by means of artificial and confined currents of air have failed to obtain velocities and attendant pressure sufficient to account for some of the feats of the natural article. While we cannot know nor be expected to build against its utmost power, the experience we have ought to induce us to estimate high velocities of wind and use low intensities of strain in materials. From 30 to 50 lbs. per square foot will blow in ordinary windows. Violent storms not sufficiently destructive to be dignified with the title of tornado have registered pressures as high as 50 lbs. They are rare, but possible everywhere, and would probably give, over a large surface, at least 40 lbs. per square foot.

In view of the constant liability of any locality to the occurrence of wind storms of destructive violence and unknown force, every tall building should be assumed to be subject to a wind pressure of 40 lbs. per square foot of exterior wall-surface, and be braced to resist this with iron or steel rods or stiff braces strained not over one-third their ultimate strength.

The stability of the individual columns in a framed structure is an element of resistance of considerable value if the connections are rigid. Even with the connections described above much ultimate resistance can be counted on from the bracketed fastenings and dead load, the ratio of base to height of each column being commonly about twelve, but because of imperfect workmanship referred to above they may at first act with, instead of against, the destroying force, and their resistance be developed only after that of the partitions is overcome or impaired. Wherever adequate rod bracing is not employed the columns should be joined together by complete splices, making each column a unit throughout the whole height of the building, and then failure could only follow the bending or breaking of the body of it at two points.

The foregoing observations have been confined to the effect of wind, but any force operating to produce violent or frequent shocks, and consequent vibrations of buildings or foundations, should be carefully regarded and as far as practicable provided against. Close proximity to the track of a steam-road, elevated or surface, but more particularly the elevated, because of the concentration of span loads, may subject a building to destructive vibration, and the pulsations of engines or machinery, dynamos or elevators, are even more likely to be a serious menace, because of closer contact and more violent shocks. The introduction of isolated electric lighting plants and elevator machinery makes the subject worthy of thorough study, and the possibility of future construction of elevated railway lines through cities is a legitimate consideration in designing towering structures, particularly in places where foundations are laid in yielding soil like that of Chicago, where settlement must be looked for, and where it is probably hastened by vibration impacts. In such localities dependence on hollow tiles for lateral stiffness may be perilous, because light masonry readily succumbs to repeated shocks, and any unequal settlement is certain to injure such walls to some appreciable extent, and probably enough to impair their efficiency in the direction of rigidity. A certain high building on such soil was found before completion to have settled unequally several inches, and consequently was seriously out of plumb. Fortunately it was braced with adjustable rods, which were used to draw it back into a vertical position, and because of these rods no alarm is felt for it. The unequal subsidence was attributed to an injudicious proportioning of the foundation areas under the different columns, which sustain varying ratios of live to dead load. The necessity for the exercise of judg-

ment in determining such proportions is an intimation of empiricism in the business of designing, and is an additional argument for avoiding uncertain materials in construction.

Another force that is entitled to respect, but is usually ignored in our latitude, though liable to be active at any moment and most powerful to destroy, is earthquake. A notable building in San Francisco has iron plate web bracing from top to bottom, designed as provision against seismic disturbances, which are more frequent on the Pacific coast than in the East, though rarely severe. No part of the country can claim immunity from them, as the experience of a few years past shows, and even slight shocks are destructive to brick masonry of low buildings, while the effect of the undulations of the earth's surface increases rapidly with the height above the ground. The only absolute security against danger from this source is in a system of bracing with some elastic material of positive strength that will so unify a structure that it will hold together even to the point of being overturned bodily, a quality which an enthusiastic writer claims offhand for steel skeleton buildings in general, but which is probably not possessed by any yet built. A reasonable degree of security against injury from any of the causes mentioned can be obtained with the above suggested provision for wind strains, care being always taken that all details, fastening of bracing, &c., are equal in strength to the main members and competent to properly transmit components of stress.

The buildings which are probably most deficient in wind bracing are those used for manufacturing. They are not as high as some others, although in cities they are increasing in height with the value of the ground, but they are often isolated, and always have large floor areas without partitions, and are stiffened only with small gusset braces or knees, which are sometimes inadequately fastened. The regular vibrations of the machinery loosen the hold of the floors upon the walls, and set up destructive movements that make it not strange that when an occasional tornado finds one of these structures in its path a disaster with appalling loss of life results.

This paper is submitted for the purpose of calling attention to some common faults in designing important works, with the hope that interested members of the profession will record, in the shape of discussion of the points involved, their judgment and observation, to the end that more uniform and improved methods of construction may prevail, a result that will certainly follow a thorough ventilation of the subject.

HOUSING OF THE WORKING-CLASSES IN EDINBURGH.

AN inquiry has just been held in Edinburgh by Lieutenant-Colonel Bailey, R.E., with reference to the application of the Town Council to the Secretary of State for Scotland to make a provisional order, under the provisions of "The Housing of the Working-Classes Act, 1880." According to the *Scotsman* the following evidence was given:—

Mr. Cooper, the burgh engineer, described the strenuous efforts of the Town Council, especially in recent years, to put the slum districts into better condition. During the last eight years 1,300 houses had been ordered to be closed, and close upon 1,000 had been improved, but notwithstanding the Council had failed to effect a satisfactory improvement, owing to the difficulty of dealing with subjects built so closely together and to such a height. He had no difficulty in selecting the areas scheduled as the plague spots of the slums. Each contained several houses which had baffled attempts at improvement. The quantity of land in each area was as follows:—A, 501 of an acre; B, 285 of an acre; C, 150; D, 1753; E, 813; F, 542; G, 147; H, 074; J, 180; K, 1683—in all, 6,128 acres. He had ascertained the number of persons who would be displaced to be 2,712. He was of opinion, however, that all these persons could be housed in or near the existing areas, where there were about 900 available houses, with rentals of from 6l. to 10l. The cost of the acquisition of the properties was estimated at 94,930l., and the cost of taking down, laying out and paving was estimated at 15,603l.—in all, 110,533l. Taking the areas in detail, area A, Campbell's Close, was the most insanitary and troublesome in the Canon-gate. The local authority had in the past dealt with nearly every house, and he attributed their want of success to the bad internal arrangements, the long, dark, tortuous passages, the unwholesome smells to which the number of unoccupied houses contributed. There were ninety-five houses to be taken in this area, and the number of houses proposed under the scheme was about the same, so that the persons displaced could ultimately be reinstated. The cost was estimated at 9,655l. It was the opinion of the Town Council, and it was his opinion, that a permanent improvement on the areas in question was impossible, and accordingly the Corporation scheme was one of reconstruction, by which a number of new tenements would

be erected, and others would be rearranged and improved. The Corporation would insist upon the new houses having independent accesses, and so far as possible plenty of light and air, and sufficient sanitary conveniences. Area B, which lies between the Cowgate and the High School Yards, was one of the most insanitary, overcrowded and generally wretched in the city, and he attributed that condition to the height of the buildings and to the want of light and air. Nothing in area B would be sufficient in order to remove the character of unhealthiness from it, short of complete clearance and reconstruction. The Public Health Committee of the Town Council were at present considering whether the ground in question should not be used for the extension of the City Hospital, and if that were decided upon a total clearance of the area would be necessary. There were thirty-five families still living in the area, and there were in it twenty-seven condemned and uninhabited houses. The cost of the acquisition and demolition of the property scheduled was estimated at 4,500*l*. In area B the Corporation did not see their way to provide reinstatement of the persons displaced *in loco*, but in the adjacent wards there were hundred of empty houses suitable for the people as regarded rent and situation. In area C, which includes Jackson's Close and Craig's Close, the proposal was to clear away a number of obstructions between the different properties, so as to give adequate light and ventilation to others adjoining, and also to the closes. In that area they were sacrificing a certain number of houses in order to give light and air to the rest. The estimated cost of acquisition and of clearing out the property was 5,621*l*. The remarks as to reinstatement of people displaced in the neighbourhood which he made in regard to area B applied to C also. In area D—between High Street and Cowgate, east of Blair Street—there were six narrow, dingy, dirty and precipitous closes, and there were a number of overcrowded and badly arranged tenements with defective sanitary conveniences.

Miss Burton, I believe, has done good work in this neighbourhood, and I suppose that her house, if it stood alone, would not be interfered with?—Well, it is not a beauty. It towers above its neighbours, and uses the light and air which belongs to other people.

But the upper storeys are quite sanitary, I presume?—Yes, the houses up there are sanitary.

But the house forms part of an insanitary area, and therefore it must, under the statute, come down?—Yes. Mr. Cooper went on to explain the manner in which the Corporation pro-

posed to build on area D, and said the district would not only be benefited by the clearance of the existing property, but by the erection of model houses for the class of people who occupied it. By the scheme 199 families would be displaced, and it was proposed to provide 174 new houses. The balance of the population would be provided for in the empty inhabitable houses in the locality, of which there were plenty. The estimated cost of clearing the area, and of preparing the ground for the new tenements, was 27,810*l*. In area E—at Potterrow—seventy families would be unhoused, and the Corporation hoped to provide accommodation for them *in situ*. The estimated cost of taking down and acquiring the scheduled property in that area and of widening the street and providing for reconstruction was 12,200*l*. In area F, embracing the Lawnmarket property, it was impossible to make a satisfactory improvement without a clearance. He had seen plans that would provide for the whole population in the new buildings. The total cost of acquisition was 17,475*l*. There were 38 houses in area G, which is between Lawnmarket and Victoria Street. It was mainly a clearance area, the object being to admit proper light and air to the adjacent properties and the public courts. Twenty of the families living in the area could be rehoused in the new property to be erected, and there was accommodation for the remainder in the adjacent tenements. The cost of acquisition and of clearance in this area was estimated at 6,090*l*. In area H, between Candlemaker Row and Cowgate, the Corporation intended to rebuild, so that the people displaced would be reinstated, so far as possible, on the present site. In regard to area J, a tenement at Canonmills, there was a proposal by the proprietor to rebuild the subjects, which were unsuitable as dwelling-houses, for trade purposes. Area K—Thornbank and Ponton Street—contained 202 dwelling-houses. The area contained a number of very insanitary properties—dwelling-houses, stables, byres and other buildings. The general condition of the streets and properties was filthy. The properties were worn out, and others, not so far through, were very badly arranged internally. By the proposed rearrangement the greater part of the street, Thornbank, was widened to 30 feet, and a new thoroughfare was formed to Tollcross in continuation of Penton Street. The further advantage of the widening of Fountainbridge would be obtained by the scheme. All the families displaced would be reinstated on the area. The estimated cost of acquisition and of clearance in area K was 23,300*l*.

Mr. W. Hamilton Beattie, architect and civil engineer,

GRINNELL

The Sensitive Automatic

GRINNELL SPRINKLERS are at present protecting 15,000 Buildings in all parts of the World, including Theatres, Shops, Warehouses, &c.

1,300 FIRES have been Extinguished by the GRINNELL at an average loss of **£55 PER FIRE.**

ARCHITECTS should SPECIFY for GRINNELL SPRINKLERS for Theatres, Clubs, and Public Buildings. They can be erected in Mansions without disfiguring the appearance of the rooms or ceilings.

GILBERT WOOD & CO., 175 STRAND, LONDON. W.C.

stated that, from his intimate acquaintance with the carrying out of the Improvement Scheme of 1867, he could speak not only of its urgency at that time, but of its highly beneficial effect both upon the districts directly operated upon, and upon the general sanitary condition of the city. It reduced the death-rate of the city about one-third. Of the people who were displaced by that scheme, a considerable proportion went out to healthier houses in the suburbs, others moved into large old houses in the neighbourhood which were thereupon subdivided to suit them, whilst others settled in the new houses which were erected within the improved areas. The subdivision of these old houses had brought about an overcrowded and undesirable state of things sanitarily, and in that view the present scheme appeared to be the natural and necessary sequel to the scheme of 1867. He had examined the buildings in all the areas now scheduled, and his opinion was that they were either absolutely unhealthy houses, or were what might be called obstructive houses, which it was necessary to remove for the sake of obtaining light and air. He had considered the scheme of reconstruction proposed by the burgh engineer, and he thought it was judicious and sensible. If it erred in any way, he thought it was in endeavouring to provide more accommodation than he (the witness) might be inclined to provide; he might be disposed to give rather more open space. He was prepared to agree with the proposed reconstruction in areas D (between High Street and Cowgate, west of Blair Street) and K (the Thornybank district)—the only two areas about which there was any question. He was of opinion that the burgh engineer had anticipated criticism as to area K, because he had prepared an alternative plan of reconstruction, which the witness explained to Colonel Bailey and Mr. Blair. Replying to Miss Burton, he stated that he knew her tenement in area D, and that in the sense of the Act he thought it was insanitary. It had no ground attached to it; it was dependent for its light and air to a considerable extent on other people's ground, and it was much higher than would be allowed by modern legislation. Further, the passages were very dark. Answering Colonel Bailey, Mr. Beattie said he understood that the plans for reconstruction were purely tentative, but so far as present information went he approved of them generally. No doubt improvements might be made, and no doubt that was the intention of the Corporation. It might be of benefit if the Corporation consulted qualified professional men before finally approving of the scheme. Possibly there might be an increase of rental in the new buildings of 25 per

cent. Replying to Mr. Comrie Thomson, the Witness said that all the people who would be displaced by the carrying out of the scheme would not necessarily have to go into new and more expensive houses; there were empty houses in certain localities.

Mr. Thomas Laing, burgh assessor, Edinburgh, stated, in answer to Mr. Comrie Thomson, that, in company with Mr. Allison, house factor, he had carefully gone over and valued all the properties in the approximate valuation of 94,740*l.*, made up as follows:—A, 7,250*l.*; B, 4,500*l.*; C, 4,100*l.*; D, 19,200*l.*; D 1, 1,910*l.*; D 2, 700*l.*; E, 6,797*l.*; E 1, 4,403*l.*; F, 15,475*l.*; G, 5,670*l.*; H, 1,125*l.*; J, 550*l.*; K, 21,505*l.*; and K 1, 1,555*l.* He had also prepared tables as to the number of occupied, unoccupied and uninhabitable dwelling-houses within these areas as at November 1892. The number of habitable unoccupied houses in the thirteen wards of the city as at Whit-Sunday 1892 was 2,812, of which 802 were under 6*l.* rental, 712 between 6*l.* and 10*l.* rental, 705 between 10*l.* and 20*l.* rental, and 598 of 20*l.* rental and upwards. Replying to Mr. Blair, witness stated that in area K he had adopted from nine to eighteen years' rental as the basis of his valuation.

Mr. James Waterston, builder, examined by Mr. Blair, stated that he had had much experience in valuing all kinds of property, and had had a good deal of experience in sanitary matters. He had recently examined 34 South Ponton Street. The property was in fair repair, rather above the average of its class of property.

Q.—As to the sanitary conditions there, what do you say?

A.—I think it might have been better if there had been less. There is too much sanitation. There are five closets for six small houses. He had not observed anything as to the prevalence of disease.

Q.—As regards any defects which may exist, could these easily be remedied by the expenditure of a little money?

A.—Well, I don't suppose the property is more than sixty years old. It is in good repair.

Q.—Is it property that can be described as insanitary?

A.—No.

Cross-examined, the witness said that a portion of the property was practically back to back to another house.

Q.—Is that an advantage or disadvantage?

A.—Rather a disadvantage.

It was not, he further stated, considered good sanitation to have access to a closet through a living room.

The report of Lieut.-Col. Bailey will be forwarded.

WOODWORK AS A DECORATION FOR THE HOUSE.

WE shall be doing a service to our readers by calling their attention to the mouldings and other finished woodwork designated "Goehring" of Messrs. J. M. Bennett & Sons, of Manchester, the old-established and well-known firm of timber

The beauty of geometric designs is well known. The graceful effects that can be produced in "Goehring" are unlimited, and at the same time it is an inexpensive mode of decoration, and a style that accords with true artistic methods. It is not possible for everyone to indulge in the sumptuous woodwork that graced our old halls and mansions, yet it seems

merchants, who have the sole right to manufacture "Goehring" in Great Britain, Ireland, &c. It is a process effected by use of Dr. C. L. Goehring's geometrical wood-moulding machinery, and the most excellent artistic results are obtained in the mouldings, all of which are cut out of solid timber. Messrs. Bennett & Sons have prepared an illustrated catalogue which should have

quite possible that by means of "Goehring" the same beautiful effects may be produced in ordinary buildings with probably no more expense than other methods that require renewing periodically. Some important structural details given in the catalogue show how difficulties of common experience in fixing woodwork are done away with. The designs shown throughout

a place in every architect's office. It is a very handy size, beautifully got up, contains a mass of useful information, and evidently no pains have been spared in its preparation. Even the cover has been utilised, and shows a handsome dado in relief. We believe it is intended to shortly issue a still more elaborate catalogue. In the present one, however, nothing appears to have escaped notice by the compiler, and it quite deserves to be called a treatise on ornamental woodwork.

are excellent, and "Goehring" is well illustrated as used for ceilings, dados, staircases, furniture, and other fittings. Elaborate counters for banking premises, newspaper offices, luncheon bars, handsome mouldings, cornices, door panellings, &c., even to picture-frames, can have "Goehring" advantageously applied. The process has also this advantage that the mouldings do not cut up to waste, as the smallest odds and ends can be utilised for ornamental purposes. Specimens and samples

of "Goehring" and a variety of the designs can, we understand, be seen at Messrs. O'Brien, Thomas & Co.'s, Lion Wharf, Thames Street, London.

The illustration shown, specially prepared and here published for the first time, will give an idea of the adaptability of the material. The smaller engravings are selected to show the effectiveness of the mouldings, without reference to any particular one among the variety of excellent designs.

HARBOUR WORKS AT VENICE.

THE last report of the British Vice-Consul at Venice describes the works at Lido Port:—The long and narrow island which goes from north to south as far as Malamocco Harbour is, he says, called Lido. Pietro Giustiniano states that there were there two high towers older than Venice, which the Venetian writer Bernardo alleges to have seen with his own eyes. The first record of the port of Lido is a description of the departure in 998, on Ascension Day, of the Venetian fleet, which subsequently defeated the Dalmatians and established the supremacy of Venice in the Adriatic. The Doge was honoured with the title of Duke of Dalmatia, and from that time forward the famous ceremony of the betrothal of the sea was celebrated every year on Ascension Day in the port of Lido. About 1202 the Venetian fleet, under the command of the Doge Enrico Dandolo, consisting of 240 ships of war, 70 transports, 50 galleys, and about 150 "palandre," left the Lido with troops on board, bound for the conquest of Constantinople. It is evident from the departure of such a powerful fleet that the port was at that time deep, wide and easy of access. But in subsequent centuries the conditions changed, for a decree was issued by the Republic permitting ships to throw their ballast overboard before entering in order to pass through more easily. In the fourteenth century vigorous attempts were made to deepen the port by means of barges and men, and by making the mouth of the river Brenta flow into the port. In 1402 1,000 men were employed to excavate a bank which had formed near the entrance; but all the efforts were of no avail, as in 1541 only small craft could go out of the port. Gradually, however, it was naturally deepened, and during the last period of the Republic the galleys found easy entrance and exit through the Lido waters. The new works for the reopening of the port began several years ago. The construction of the north-east breakwater, which starts from the point of Treporti, was

commenced in 1882. It is to be 3,450 mètres long, of which 2,900 have already been constructed. The building of the south-west breakwater, which starts from the Port of Lido, began in March 1889. It is to be 2,850 mètres long, of which 1,450 mètres have been completed. The two breakwaters jut out to the sea, forming at their extremity a mouth 900 mètres wide. The construction of the portions under water is of ashlar blocks of Istrian stone and stone from the hills in the province of Padua, while the upper parts are composed of large artificial blocks of pounded stone and "pozzuolana." About 1,500 mètres distant from the seashore there is a bar running parallel to it. Owing to the construction of the breakwaters a channel was cut by the current through the bar about five mètres deep at low tide and of a breadth varying from 100 to 250 mètres. Gas conical buoys have been moored at sea opposite the breakwaters to mark their extreme limits. The buoy marking the north-east mole exhibits a fixed red light of the range of $5\frac{1}{2}$ miles, while that marking the south-west pier exhibits a fixed green light of the range of $4\frac{1}{2}$ miles. Fort San Nicolo light has been discontinued, and the white bell buoy previously marking the extremity of the north-east breakwater has been withdrawn. Although the works will not probably be completed before 1895, it is expected that next year the Lido Port will be rendered navigable for the largest vessels. Two large Italian merchant steamers and an English steamship have already gone out of the port at high tide in charge of pilots. The estimate of the expenditure is 240,000*l.*, but it is expected that a much larger amount will ultimately be laid out by the Italian Government.

BUILDING TRADES EXHIBITION.

WE would call the attention of our readers to an announcement made in our advertisement columns, that the eleventh annual Building Exhibition will be held during the weeks from March 11 to March 25 at the Royal Agricultural Hall, Islington. No pains will be spared to secure for the exhibition a perfectly representative collection of products, appliances and machinery used in the building trades, and we trust that as usual all the well-known firms who have so successfully catered for the needs of architects and builders' will be well represented. Applications for space should be made at once to Mr. John Black, secretary, at the Exhibition Offices, 2 Newcastle Street, Strand, W.C.

REGISTRATION OF PLUMBERS.

THE plumbers of the Manchester district registered in connection with the Worshipful Company of Plumbers, London, held their annual meeting on Saturday at the Technical School. The president (Mr. John Holden, F.R.I.B.A.) occupied the chair. The report stated that during the past year a satisfactory increase in the number of names on the register had taken place. There had been two examinations during the year, at which five masters and twenty-five operatives had presented themselves. Of these four masters and thirteen operatives had passed, and one master and twelve operatives had failed. Amongst the principal matters which had engaged the attention of the Council was the Plumbers Registration Bill, promoted by the Plumbers' Company and introduced by Mr. Lees Knowles, M.P. A sub-committee of the Council recommended certain alterations, which were forwarded to the Company and Mr. Knowles. The Bill was ultimately referred to a select committee. Shortly stated, the desire of the Council has been (1) to ensure a representative and practical form of government for the movement, instead of the ornamental, largely irresponsible, and, in the opinion of the Council, consequently inefficient form proposed; (2) to secure autonomy for the district councils, especially in the control of their funds; (3) to provide for such discipline as would secure prompt compliance with all rules and by-laws; and (4) that no official appointments be made by Act of Parliament, inasmuch as if so made application to Parliament to enforce obedience to the governing body at any time would be necessary. The Council are wishful to give their cordial and loyal support to the Company, but reserve the right of exercising their own judgment as to the form a Bill should take which, when passed into law, would be binding upon them and their constituents in common with all other branches of the organisation. The Council trust, therefore, that when the Bill is next introduced the provisions will be so modified as to enable the Council to support it without reservation. With a view to the encouragement of study, the promotion of excellent workmanship, the observation of defective plumbing, and the cultivation of facile expression or record of the results of reading and experience amongst plumbers, a prize fund was raised. The prize essays and others of sufficient merit are to be published. The treasurer's statement showed that the receipts during the year had been 159*l.* 0*s.* 7*d.*, and expenditure 150*l.* 17*s.* 6*d.*, the balance left in the bank being 126*l.* 18*s.* 11*d.* The Chairman, in moving the adoption of the report, alluded

to the new Registration Bill brought in since the reassembling of Parliament, and which had already passed the second reading. He said the views of the Manchester Council had to some extent been considered in drafting this Bill, but there was still room for improvement. A sub-committee was appointed to prepare amendments and arrange for their being moved in Committee. The report and accounts were passed, and a vote of thanks given to the chairman for the great interest he takes in the movement.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

3137. Herbert White, for "An improved stench-trap for drains, sewers and the like."
 3173. William John Henry, for "An improved lock for trunks, boxes and like purposes."
 3258. James Emmott and Bernard Emmott, for "Improvements in chimney-pots."
 3283. William Davis, for "Improvements in tops or cowls for chimneys, ventilating shafts or the like."
 3340. Harry Richardson, for "Improvements in or additions to fire-hose, branch pipe nozzles or jets."
 3379. Agnes Edith Jane Hemingway, for an "Improved window fastener."
 3442. Edward Martin, for "A combination level, bevel and square."
 3474. Enoch Pinson, for "An improvement in sash-fasteners, for the purpose more especially of increasing their security."
 3620. William John Brett and William Dingley, for "An improved automatic vent-peg."
 3639. William Oakley, for "Improvements in locks."

ROYAL AGRICULTURAL HALL, LONDON.

ELEVENTH ANNUAL

BUILDING EXHIBITION

Of all Industries connected with the Building Trades,

MARCH 11 to 25, 1893.

"THE ARCHITECT" says of the 1892 Exhibition:—

The representatives of all industries connected with the building trades will be wise to commence at once their preparations for the Exhibition. There cannot be as loud a preliminary flourish about an Exhibition in Islington as there is always about one of those designated as "International"; but if exhibitors will consider the results of the two classes, they will discover that in the former they have met men of business and received orders, while for the privilege of participating in the universal shows they have not only lost large sums, but discovered that the dilettanti and holiday makers, who constitute the mass of visitors, are not fascinated by the best aids to construction.

JOHN BLACK, Secretary.

Exhibition Offices: 2 Newcastle Street, Strand.

QUANTITIES, &c., LITHOGRAPHED

Accurately and with Despatch.

TRADE NOTES.

ON Monday last the Duchess of Albany formally started the new turret clock and bell just erected in the tower of St. George's Church, Cannes, an edifice which has been built as a memorial to the late duke. A cord connected with the clockworks being severed by Her Royal Highness, the clock was set in motion, after which a service was held in the church, the Bishop of Gibraltar officiating. The clock, &c. has been manufactured and erected by Messrs. Gillett & Johnston, of Croydon, all the workmanship and materials being of the best quality. The clock is constructed to show the time on three dials each measuring 5 feet in diameter, and the bell upon which the hours are struck weighs upwards of 7 cwt. and measures nearly 3 feet across the mouth, the note when struck being slightly sharp of G. All the latest improvements have been introduced into the clock; amongst others might be mentioned Lord Grimthorpe's "double three-legged gravity" escapement, generally recognised as the best and most perfect escapement that has yet been devised. The pendulum is also worthy of notice, inasmuch as it is compensated to withstand all variations of temperature, and thus always remains the same length, upon which the timekeeping qualities of the clock in a very large measure depend. An engraved and silvered brass plate has been fixed to the frame of the clock bearing the following inscription:—"Presented to the church of St. George, Cannes, by Arthur Ussher, A.D. MDCCCXCIII." The inscription is cast upon the bell. The whole of the work has been done in a very satisfactory manner by Messrs. Gillett & Johnston, who have also now in hand large clocks and bells for Surrey County Buildings, Kingston; Messrs. Stephens's Ink Factory, Finsbury Park; and Shanghai Custom House, Bermuda Session House, St. Andrew's Kirk, Bangalore, &c. &c.

THE Valley of the Wandle, in the district of Tooting, has long been noted for its overflowing artesian wells, but th

147 STRAND, LONDON, W.C.

numerous borings into the chalk of the London basin have considerably reduced the level of the springs of late years, so that most wells have ceased to overflow. That this source of supply is, however, still copiously fed from the outcrop of the chalk has just been forcibly demonstrated by an artesian tube well which has been bored by Messrs. Le Grand & Sutcliffe, hydraulic engineers, London, at Mr. Chambers's watercress beds, Haydon's Road, midway between Wimbledon and Tooting. The depth bored is 166 feet, reaching about 30 feet into the chalk formation, upon penetrating into which the water rose 17 feet above the ground, and the overflow at surface level is at the rate of no less than twenty-two tons of water per hour.

A NEW turret clock striking the hours on the large or tenor bell, and showing the time upon one external copper dial 4 feet in diameter, with copper hands, all being well painted and gilt, has recently been erected in the tower of the parish church, Draughton, near Northampton, by Messrs. W. Potts & Sons, clock manufacturers, Guildford Street, Leeds, the work being of the very best quality and finish, and the clock-dial and hands have a neat and effective appearance. The new dial faces towards the south, and is far more useful to the inhabitants than the old clock dial, which was on the west side. The donor of the clock is Mr. Reginald B. Loder, Maidwell Hall, Northampton, Messrs. St. Aubyn & Wadling, of Lamb's Buildings, Temple, London, being the architects. Messrs. Potts & Sons are also making new clocks for Wortley Church, Sheffield; Hartlepool parish church; Yorkshire Penny Bank, Bradford; Thurlestone, near Penistone; Oldham, and other places.

THE Public Parks Committee of the Edinburgh Town Council have accepted estimates, amounting to about 400*l.*, for the construction of a bowling-green in the East Meadows Park.

MUCH to the convenience of those having business to transact in the Liverpool Municipal Buildings in Dale Street, a lift worked by hydraulic power has just been placed in the buildings by Messrs. Waygood, of London.

THE Paisley Water Commissioners have placed the contract for the construction of the boundary wall, filter bed and laying of cast-iron pipes in connection with the new filter at Craigenfeoch in the hands of Mr. R. B. Stewart, Saltcoats, the price being 857*l.* 4*s.* 10*d.*

THE Chester Town Council have passed a recommendation of the Joint Public Health and Sewering Committees in favour

of purchasing about 418 acres of land, at a cost of 27,000*l.*, for use of a sanitary depôt in connection with the city sewerage. Sanction from the Local Government Board will be applied for for raising the money.

CHICAGO EXHIBITION NOTES.

AN exhibit of wall-papers has been prepared by Messrs. W. Woollams & Co., of 110 High Street (near Manchester Square), London, W., manufacturing paper-stainers, the original makers of artistic wall-papers free from arsenic. Their stand is an irregular parallelogram facing four avenues, each side divided into three sections. Among the decorations are the "Tanhope" frieze and filling, in blue and gold on light yellow ground, with dado; "Viterbo," in embossed and lacquered leather, designed by Miss Louisa Aumonier; the "Chatsworth" frieze, filling and skirting border, designed by Mr. T. W. Hay; the "Westminster" frieze and filling, designed by Mr. A. Silver, with the "Osaka" dado, embossed and lacquered leather, designed by Mr. F. Darling; the "Tweeddale" frieze, acanthus and honeysuckle, in transparent colours on mica ground, and the "Darnley," acanthus and peony, similarly treated, drawn by Mr. G. F. Catchpole, with dado "Ostiglia," in coloured flock on lacquered gold ground, designed by Mr. T. W. Hay; the "Rosebery," a bold design in flat treatment, designed by Mr. C. F. A. Voysey, and worked by a new process in variegated flocks, producing novel and beautiful effects of broken colour; with a dado, the "Cleveland," in coloured flocks on a lacquered gold ground, designed by Mr. T. W. Hay. Right side:—The "Acanthus" frieze, the "London-derry" filling, a fine combination of hollyhocks and lace, designed by Miss Louisa Aumonier, with the "Rhône" dado, in warm coloured flocks on a lacquered gold ground, by the same designer. Another frieze, designed by Miss Louisa Aumonier; filling, the "Cordova," designed by Mr. T. W. Hay, and the "Morton" dado, designed by Mr. Owen W. Davis, all worked in patent embossed flocks on lacquered gold grounds with delicate effects of modelling in low relief, and several other friezes, one designed by Mr. W. H. Noble; also a variety of ceiling papers.

THE British section at the World's Fair will be decorated in part by some seventy banners bearing respectively the arms of different municipal corporations in the kingdom.

THE "White City," as the World's Fair grounds and buildings are termed, has the equipment of a model municipality. It has a combined water capacity of 54,000,000 gallons a day, and will soon have 100,000,000. It has 25 miles of water mains and 291 hydrants. A hundred more will be provided. There are 3 steam fire-engines, 4 chemical engines, a ladder-truck, water-tower, 40 hose-carts, 26,750 feet of hose, 1,050 hand fire-extinguishers, 2,500 fire-pails, a steam fire-boat, 65 firemen, 150 alarm-boxes, 150 patrol telephones, 500 guards, complete electric light and sewerage systems, &c.

AN English salt firm has made a salt statue, modelled after Bartholdi's *Liberty Enlightening the World*, in New York Harbour. The statue is 5½ feet high, and stands on a rock-salt base 7 feet high. The salt was taken from a mine 250 feet deep.

THE King of Siam has decided to make a display in the manufactures, agricultural and forestry buildings at the World's Fair, and will also erect a royal pavilion of elaborate carved woods.

THE list of Germany's exhibitors at the Fair contains 5,077 names. Represented in it are 230 cities and towns of the empire, and of these 40 cities send more than ten exhibits each. Berlin leads with 283 exhibitors; Munich follows with 187; Leipsic with 149; Frankfort, 55; Hamburg, 57; and Chemnitz, 41.

VARIETIES.

WE hear that Mr. W. H. Radford, C.E., of Nottingham, has been instructed to prepare sewerage and waterworks schemes for the village of Helsby, Cheshire.

BY permission of Lord Blantyre the members of the Glasgow Natural History Society, in an excursion to the Bishopston district, paid a visit to the Erskine estate, where measurements and photographs were taken of several of the finest trees. Among these was a very large sycamore, measuring 16 feet 4½ inches in girth at a height of 3 feet 9 inches from the ground. Near the site of the old house of Bargarron is the famous "Witches' Oak," which measures 18 feet 9 inches in girth.

AT a special meeting of the Kirkcaldy Harbour Commissioners held to consider the new harbour question, Mr. Blyth, C.E., who made the survey of the scheme for the North British Railway, asked to be shown Sir John Coode's plan. He was informed that Sir John Coode's plan was the property

of private subscribers, and would be handed over on payment of 518%, or a guarantee for that sum. In the event of the new Ravenscraig scheme going on, Mr. Blyth's object was to compare his borings with those of Sir John Coode, to see if the sandbanks had shifted during the last nine years.

AT the meeting of the Glasgow Town Council, a plan for a recreation-hall after the style of the Crystal Palace, to be erected on Glasgow Green, was submitted. The estimated cost was 7,000*l.*, and the site proposed in the vicinity of Cumberland Street. The plan was generally approved, and it was remitted to bring up a further report, and as to the source from which the cost of the building was to be defrayed.

AN inquiry has been held in Manchester on the part of the Local Government Board, with reference to the application made by the Corporation for power to borrow 150,000*l.* for the purposes of the Technical Instruction Acts, 14,000*l.* for public baths and a public meeting-room in the township of Cheetham, and 20,000*l.* for new fire-stations in the newly-added portions of the city.

THE following arrangements for the session have been made by the Sanitary Institute:—Sessional meetings, for communications and discussions on sanitary subjects, Wednesdays, February 8, March 8 and April 12. Lectures and demonstrations for sanitary officers, specially adapted for candidates preparing for the Institute's examination for inspectors of nuisances. London:—Two courses each of seventeen lectures on Tuesdays and Fridays, at 8 P.M., the first commencing on January 31 and the second on October 3. Provincial courses of twelve lectures on Saturdays at King's Lynn, commencing January 7; Exeter, February 25; Dublin, March 18. Arrangements for other lectures are in progress.

THE committee of the Bridgnorth and South Shropshire Infirmary report that Mr. T. M. Southwell has offered to present about one acre of ground near the North Gate as a site for a new infirmary, and Mr. W. O. Foster, Apley Park, to contribute 1,000*l.* towards the building fund. The cost is estimated at 4,000*l.*

AT the meeting of the Clarkston School Board, held at Airdrie, it was reported that Captain J. Towers Clark had granted a free site at Moffat for the new infant school. Mr. George Arthur, architect, Airdrie, was instructed to prepare plans for a school to accommodate 150.

THE Sanitary Committee of the Leicester Town Council have recommended the acceptance of the tender of Mr. J. E. Johnson,

for the extension of the infectious hospital accommodation, for 1,762l. The Council negatived the recommendation, and further decided not to proceed with the work on the grounds that it would not be of a permanent character, and that extra accommodation might possibly not be required.

The *Glasgow Herald* says:—"The electric lighting of the streets of the central area of the city has advanced a stage. In order to thoroughly test the capabilities of the new installation, the arc lights have been kept burning along with the ordinary gas lamps since the inauguration on Saturday. Yesterday evening the electric lamps only were switched on, and the general public had an opportunity of seeing the streets under the rays of the new illuminant without the aid of any other light." The results were satisfactory.

NOTES ON NOVELTIES.

The "Safety" Pedestal Washdown Closet, Registered.—

This closet, which has been designed to obviate the multifarious disadvantages and imperfections found in most types of waterclosets now in the market, is highly commended as a certain safeguard against sewer gases. It is considered by

some of the leading architects, plumbers, sanitary inspectors and others, from whom we have received flattering encomiums, to be the safest and most reliable closet at present before the trade. The force of the flush is exerted directly on to the water in the

trap, insuring a thorough clearing of the contents through the trap, and a complete cleansing of every part of the basin. There is always a large surface of water in the basin and a deep-water seal in the trap. All parts being fully exposed and free of access, any defect could readily be detected and remedied. It is constructed with a highly glazed earthenware basin and strong lead trap secured to a lead pedestal pier, or support, provided with holes for securing to the floor. The separate parts are not united by screws, so that fracture by contraction or expansion is avoided. The basin is bedded into the trap with white lead, or other suitable material, in the usual way. The trap can be fixed at any angle to suit the junction or soil-pipe to which it is soldered, as shown in the engraving. The connection between the basin and trap being above the water-line makes it physically impossible for an escape of sewer gas to take place. Should the basin be broken at any time, it could be replaced for a trifling outlay, whereas the replacement of ordinary closets is a matter, in many instances, of several pounds. It is simple in construction, cheap, effective, durable, cleanly, easily fixed, and cannot get out of order. Architects may specify it with confidence, as it is sure to give the utmost satisfaction wherever fixed. Messrs. Wright Sutcliffe & Son, of Halifax, are the manufacturers.

THE BUILDING EXHIBITION.

IN our next issue detailed descriptions of various exhibits shown at the Building Exhibition opened this week at the Royal Agricultural Hall, Islington, and among them of the exhibits made by the St. Pancras Ironwork Company, Messrs. Barnard, Bishop & Barnards, Mr. Robert Adams, Mr. T. Freeman, Messrs. Ellis, Partridge & Co., Mr. Hindley, of Bourton, the Blackman Ventilating Company, &c., will appear.

Francis E. Clotten.

"Xylolith," or stone-wood, is shown by Mr. Francis E. Clotten, of 258 High Holborn. The special advantages claimed for it are that it is absolutely water, sound, dry-rot, vermin, white-ant and fire-proof; that it combines all the best qualities of the hardest stone and toughest wood; that it effectually resists all wear and is unbreakable; that it neither shrinks, swells or cracks, is almost non-absorbent, unaffected by any influence of temperature, and admits of no fungoid growth; that it is specially adapted for most building purposes, flooring

and roofing halls, passages, churches, schools, public offices, warehouses, cellars, shops, factories, railway stations and platforms, and not being porous is easily cleaned, and does not absorb or harbour impure or infectious matter. It is therefore strongly recommended for flooring and other use in dairies, hospitals, barracks, workhouses, prisons, laboratories, farm sheds and the like buildings. That it is much superior to corrugated iron for building purposes—entire private residences and official buildings, permanent or movable houses, sheds, offices, huts, &c., for use along railways, docks, &c., warehouses, stores, cricket, lawn-tennis and garden pavilions, racecourse stands, halls, chapels, exhibition buildings, bungalows and shooting-boxes, houses, &c., keeping perfectly cool in summer, and comfortably warm in winter, are unrivalled for extreme climates.

The patent automatic "peat dust" closets are shown, the peat dust having made its mark as a sanitary and deodorising agent. The closets are shown in different varieties to suit many requirements.

QUEENSLAND TARIFF.

THE following are the Customs duties upon goods, &c., used in the building and engineering industries:—

Fixed Duties.

Cement, 2s. per barrel. Iron castings, 3s. per cwt.; iron, pipes, cast, 2s. per cwt.; corrugated iron, 2s. per cwt.; galvanised iron, 2s. per cwt.; iron wire, 2s. per cwt. Lead, piping and sheet, 2s. per cwt.; white and red lead, 3s. per cwt. Oils, mineral, 6d. per gallon. Paints, wet and dry, 3s. per cwt. Tanks (iron), 8s. each. Turpentine 6d. per gallon. Timber logs, 1s. 6d. per 100 sup. feet; timber (undressed), of a scantling under 96 square inches, 1s. 6d. per 100 sup. feet; timber (dressed and sawn), of a scantling under 96 square inches, 3s. per 100 sup. feet.

Ad Valorem Duties.

For every 100l. of the value thereof a duty of 5l.:—Ash timber (in plank); carriage shafts, spokes, felloes, naves, hubs, bent wheel rims; furniture springs. For every 100l. of the value thereof a duty of 15l.:—Agricultural machinery. Artists' colours. Asphalte, asbestos (unmanufactured). Carriage-makers' materials, castors for furniture. Casks and staves and heads imported in shooks. Cutlery, gilt moulding, gold and silver leaf. Ironmongery and hardware, viz.:—Bolts and nuts

over $\frac{3}{4}$ of an inch diameter; door-knobs—glass, brass, china; emery cloth, emery paper, emery powder; hammers; hinges; holystones; irons—batters', Italian, smoothing, and tailors'; latches; locks; mortice furniture, all kinds; patent door-springs; pencils (carpenters'); sash-fasteners; staples for fencing; tinfoil; tinned rivets; weighing machines of all kinds and weights for same. Marble and stone unwrought. Paper-hangings. Tar (Stockholm).

Articles exempted from duty.

Bolts and nuts and bolt-heads, and nuts $\frac{3}{4}$ -inch diameter and under, in lieu of bolts and nuts exempted by third schedule of the Custom Duties Act of 1888. Boiler-plates, boiler tubes. Brass—bar, sheet and rolled. Buckles of every description. Carriage and cart-makers' materials, namely:—Spring steel, brass hinges, tacks, tyre-bolts, shackle-holders, rubber cloth and American cloth. Copper—sheath, plain, ingots. Copper—rod, wire. Copper nails. Copper wire, thread-covered. Dynamite, gelatine dynamite, lithofracteur, blasting-powder, fuse, detonators and other explosives, except gunpowder. Eyelet punches and eyelets. Fire-engines. Glaziers' tools. Grindstones. Iron ore, iron, plain sheet (not including galvanised). Iron, pig. Iron, bar. Iron, rod, from $\frac{3}{16}$ ths to $\frac{1}{2}$ inch; channel iron, angle and tee iron, rolled iron joists up to 10 inches by 5 inches. Iron, scrap. Iron, hoop. Malleable iron and copper piping. Metal fittings for portmanteaus, travelling bags and leggings. Metal frames for bags and satchels. Muntz metal. Machinery of the following description, not including engines and boilers:—Flour-milling, lathes over 3½ tons weight, drilling machines over 7 tons weight, shearing machines over 7 tons weight, plate-bending machines over 2½ tons weight, punching machines over 5 tons weight, slotting machines over 4 tons weight, shaping machines over 2½ tons weight, book-binding and ruling machines, Yaryan evaporators, canning machines, steam-threshing machinery. Mill stones. Metal tubing, except tin, zinc welded, and lead. Ores. Machinery for carding, spinning, weaving and finishing the manufacture of fibrous material, and cards for such machinery. Machinery—dry air, for refrigerating, without engine. Machinery used in the manufacture of paper and felting. Gas engines. Portable engines. Centrifugals—multiple effects. Traction engines and steam ploughs. Sewing machines. Tubing for artesian wells. Freezing machines, not including engine power. Machines, namely—planing machines, and machines for joinery, hot-air machinery for drying timber, hydraulic hat-moulds, knitting

BUILDING REGULATIONS IN NEW YORK.

A BILL has been introduced in the New York Senate by Senator Amasa J. Parker, to provide for the construction, regulation and inspection of buildings in the several cities of the state, except in the cities of New York and Brooklyn. According to *Architecture and Building*, the whole Bill is virtually the New York Building Law toned down to reasonable requirements to compel cities that had no—or no adequate—regulations to protect the life and property of the general public. Particular care seems to have been taken to avoid any possible unfairness by the building authorities, and provision is made that where a permit has been refused to an owner who claims that the provisions of this Act do not directly apply, or that an equally good and more desirable form of construction can be employed in any specific case than that required by this Act, then the owner or his representative shall have the right to present a petition to the superintendent of buildings, together with a deposit of 30 dollars, requesting the appointment of an examining board, and thereupon the superintendent of buildings shall appoint a disinterested and competent architect or builder, the applicant shall appoint a second, and the two so chosen shall select a third. The examiners shall consider such petition, and, as soon as practicable, render a decision thereon. The board of examiners are authorised and empowered to grant or reject such petition, and the decision of a majority of them is to be final. The Bill provides that superintendents of buildings and deputy superintendents of buildings shall be competent architects or builders of at least ten years' practice. The inspectors shall be competent men, either architects, civil engineers, masons, carpenters, or ironworkers, who have served at least ten years as such. In cases where buildings are declared to be unsafe, and owners do not secure or remove them, they are to be notified that a survey is to be held by three competent persons, each of whom shall be a practical builder or architect, and one of whom shall be the superintendent of buildings or one of his assistants, another of whom

shall be appointed by the owner, and the third by the two thus chosen. If the person or persons on whom said notice is served refuse or neglect to appoint a surveyor, within a time fixed in the notice, the superintendent of buildings shall appoint a builder or architect to act for the person or persons so served with notice, and said two persons may make the survey; and in case of disagreement they shall appoint a third person, a builder or architect, to take part in the survey. If the person acting on behalf of any department or bureau of buildings, and the surveyor appointed by the person or persons on whom any such notice was served, shall neglect or refuse to choose a third person to act upon any survey, within a reasonable time, the superintendent of buildings shall designate such third person. The survey fee is limited to ten dollars each to the two chosen outside the member of the building bureau.

ECONOMIES OF ELECTRIC LIGHTING.

A MEETING of the Architectural Section of the Philosophical Society of Glasgow was held recently, when Mr. T. Crichton Fulton, electrical engineer, read a paper on "The Economies of Electric Lighting and Power Transmission." Mr. Campbell Douglas occupied the chair. Mr. Fulton at the outset drew attention to three aspects of the question which he wished to present, though he would make no attempt rigidly so to divide his treatment of the subject:—(1) The economy which results from the use of electricity; (2) economy in the choice and erection of the necessary plant; and (3) economy in the use of the plant itself. Proceeding to treat of the manner in which electricity is generated in large quantities in modern days, he briefly showed how this was effected, and pointed out that the two essentials were a dynamo and some mechanical means of rotating its armature. The means adopted varied with varying conditions. If water-power was handy, it was by far the most economical, especially if there was facility for storage and an ample supply. Where coal was very cheap steam-engines and boilers might be found more suitable, though their efficiency of conversion was certainly very low indeed. Where neither of these prime movers was convenient, gas-engines, which had been enormously improved of late years as regards efficiency, steadiness, and freedom from noise, and which were both cleanly and handy to work, would be found of great service. There were many mills, factories, &c., which

THE WELL-KNOWN FRIEZE,

ENTITLED

"THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo,

BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*.
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

had a considerably greater power—either engine-power or boiler-power or both—than was needed to drive their machinery, and certainly it would be a direct economy to use this surplus power for lighting the premises. In speaking of the distribution of the current, the lecturer condemned as a very "penny-wise-and-pound-foolish" policy the use of two small conductors, or of conductors which were not well insulated. Too small conductors caused too great frictional resistance; this again caused heating of the conductor, which was not merely a source of waste, but a positive menace to life and property. He then described shortly the construction and action of incandescent lamps, and pointed out how much superior they were to our present modes of lighting as regards health, cleanliness, safety and steadiness. The arc light was next touched upon, and was shown to be both suitable and economical for large buildings and open spaces, such as harbours, stations and public streets. This light was not merely the safest, but by far the most economical to use for such places as chemical works, match factories, timber yards, paper mills (where the processes have to be carried on night and day), hospitals and dwelling-houses. In speaking of the transmission of energy by means of electricity, Mr. Fulton instanced the cases of a mine in New Zealand, where the generating plant was placed near the coast, and the current transmitted five miles to the mines, which were situated some 2,000 feet above the sea-level; and of the recent experiments in Germany, when 72 per cent. of the water-power derived from the falls of Lauffen was transmitted over 100 miles to the Frankfort Exhibition, there to be retransformed into mechanical energy by means of electro-motors. Small electro-motors were quite as efficient as large ones—which steam-engines were not—and the time might not be far distant when, in some industries at least, the present plan of centralising the whole operations in one huge factory might be changed for one in which workmen carried out many of the processes by the aid of electricity at their own fireside. The lecturer next gave his audience some idea as to the cost of erecting and working installations, though this could not be done with any accuracy owing to the great variety of conditions. It was necessary, however, to have the work properly planned and arranged, and thoroughly superintended and tested, in order to avoid as much as possible the risk of failure, annoyance and frequent outlays for alterations and repairs very soon after the work had been completed. This could only be done adequately by having skilled advice from an independent source.

FALL OF CHIMNIES.

IN St. Helen's much excitement has been caused by the fall of the highest chimney in the town, viz. one in the Greenbank Alkali Works, belonging to the Alkali Union. The chimney was 300 feet in height, and the diameter at the base was 26 feet. During one of the gales last week, and without any warning, the chimney came down with a crash, the whole volume of the bricks falling around the base of the structure. The material in its fall crashed on the woodwork adjoining among the vitriol tanks, and a large quantity of liquid was lost. The hydrochloric acid condensers were also partially destroyed, the chloride of manganese tank and a great deal of the machinery connected with the bleaching plant damaged. The ropery belonging to Messrs. W. J. Glover & Co. was also damaged by the falling *débris*. The business at the Alkali Works is of course suspended, and about two hundred men are left without employment.

About the same time there was a similar occurrence at Widnes, which caused, moreover, the death of two workmen. A chimney-stack, 90 feet high, in the works of the United Alkali Company, which had suffered considerably by the recent storms, was being repaired by Messrs. J. Whitehead & Co., Liverpool. The defective portion consisted of only about 6 feet of coping and brickwork at the top of the stack, and as the mortar had been eaten away by the chemical gases emitted from the chimney, it was found necessary by Mr. Whitehead to displace an iron band encircling the chimney at the top and remove the bricks and coping-stone one by one. A substantial pole scaffold having been erected, the work of demolishing the defective portion was proceeded with. On Saturday afternoon, without any warning, a portion of the brickwork, probably about half a ton, fell upon the scaffold, tearing a portion of it away, and two of the men who were working upon it were thrown to the ground, 85 feet below. One, who fell upon his head, was picked up dead, while his companion fell upon his right shoulder and received serious injuries which terminated fatally shortly after his admittance into the Accident Hospital. None of the other workmen were injured, but several had narrow escapes from the falling *débris*. The men were fully competent to discharge the work which brought such a sudden and fatal termination to their lives. The firm of Messrs. Whitehead & Co. have repaired a number of chimney-stacks in

THE "ECLIPSE" PAINT REMOVER & CLEANSER.

The Best, Cheapest, and Most Effective in the World.

1a CRESCENT, MINORIES, LONDON, E.C.

Widnes, and this is the first accident they have had which has been attended with fatal consequences.

At the inquest on the two men who were killed the evidence was to the effect that the company, believing the top portion of the chimney connected with the salt-cake department of the works had become defective, put the repairs in the hands of Messrs. J. Whitehead & Co., steeplejacks, Liverpool. It was then found that the acids from the gases of the salt-cake manufacturing process had eaten away the brickwork and mortar of 12 feet of the top of the chimney, which was about 35 yards high. Six men, under a sub-contractor named Lonsdale, removed the heavy iron hoop from the top, and Boden and Mains were left on the scaffolding (an ordinary pole one used in similar work) to remove the bricks one by one. A portion of the brickwork gave way and broke one of the poles and planks, but these were replaced with new ones, and according to all the witnesses who were called, the scaffolding was made as safe as when first erected. Two of the men, however, had only just reached the ground when they heard a crash, and on looking up saw the stage of the scaffolding on which Boden and Mains were working, together with a quantity of brickwork, falling to the ground. Boden was picked up dead, and Mains only survived a couple of hours. The witnesses admitted that the brickwork was not taken down "course by course" and a level surface left, which is usually done, because there was a breach in the chimney which necessitated one side of it being left about a yard and a half higher than the other. The jury after viewing the scene of the accident returned a verdict of accidental death, and attached no blame to anyone.

LONDON SANITARY PROTECTION ASSOCIATION.

THE twelfth annual meeting of this Association has been held at the house of the Society of Arts, Dr. J. S. Bristowe in the chair. The report of the Council for the year 1892 showed a further increase of membership, 506 having joined during the year. Five hundred and thirty-five houses had been inspected for the first time, of which 68 per cent. were reported as in a more or less bad condition, a rather larger proportion than the average of the previous eleven years, showing that the necessity for the Society's existence is as great now as when it was founded. Amongst the buildings inspected were sixteen hospitals, schools or other public institutions. The Council

regretted that no application had been received for the inspection of any working-class dwellings, but they had given an additional donation of 10*l.* to the Mansion House Council on the Dwellings of the Poor. Application had been made for a share of the Berridge legacy, and if this proved to be successful, the Council hoped to be able to at once take steps for rendering the results of their twelve years' experience available for promoting the general advance of sanitation by means of lectures, publications, &c.

The Chairman, in moving the adoption of the report, referred to the excellent work done by the engineers, which must have had indirectly an influence for good far beyond the membership of the Association.

Lord Chelmsford seconded the motion, which was carried unanimously, and the Council and officers were re-elected, the Duke of Argyll being president.

HOUSE MOVING.

THE *Scientific American* says:—The ferry-house located at the Brooklyn terminus of the Thirty-ninth Street ferry, between the Battery in New York and South Brooklyn, is a brick structure 52 by 110 feet. This building was located at the foot of Thirty-ninth Street. The Brooklyn City Railroad Company required increased facilities in that part of the city, and in consequence of this the ferry-house was removed from its original site 140 feet westward and 25 northward, and when the job is completed the building will stand 17 inches lower than it stood on the old site. This work was done in about one month, without injury to the walls, and at much less expense than would have been involved in tearing down and rebuilding.

The building was placed on a rigid framework and its walls were shored and braced by tie rods and cross timbers, and it was moved on ways consisting of a framework of heavy timbers provided with diagonal guides which caused the building to move sidewise as well as endwise, the frame upon which the building rested being provided with shoes sliding upon diagonal guides. The abutments against which the moving screws rested were heavy timbers secured to the ways by means of chains. After the screws which abut upon the timbers had been run out their full length, they were returned to their original positions and the timbers moved forward and again made fast, when the operation was repeated.

THE ACME WOOD FLOORING COMPANY, Ltd.,
Chief Office and Works—Vauxhall Walk and Glasshouse Street, London, S.E.

This job was done by B. C. Miller & Son, of Brooklyn, N.Y., who moved the Brighton Beach Hotel bodily in 1888, after the damaging encroachment of the sea on the beach. The building was 465 feet long and 150 feet deep, three storeys high and weighed 5,000 tons. It was moved 239 feet back of its original position upon 112 platform cars by means of six locomotives.

THE COVENTRY BATHS.

At the meeting of the Coventry City Council the Baths Committee presented a report with the following list of tenders for the engineer's work in connection with the hot and cold water supplies and heating apparatus of the new baths:—

C. H. Ewen, London	£2,387	0	0
J. C. & J. S. Ellis, Sheffield	2,375	0	0
Russell & Co., London	1,795	0	0
Thomas & Taylor, Stockport	1,794	0	0
Fraser & Son, London	1,792	0	0
T. Parkes, Birmingham	1,746	4	6
J. Braithwaite & Son, Kendal	1,735	0	0
Berry & Sons, London	1,689	0	0
Griffin Foundry Co., Birmingham	1,675	0	0
J. & F. May, London	1,625	0	0
Bradford & Co., Manchester	1,616	0	0
W. Summerscales & Sons, Keighley	1,600	0	0
Harper Twelvvetres, London	1,525	0	0
Murdoch & Cameron, Glasgow	1,524	14	0
Coventry Gasfittings Co., Limited	1,390	0	0

The balance of the provision for this work, after allowing for the boilers, which were ordered independently, is 1,970*l*. The committee recommended that the tender of the Coventry Gasfittings Co., Limited, be accepted.

It may be of interest to reprint the estimates for this work which were published in the *Architect* last October as below:—

Benham & Co.	£3,475	0	0
Russell & Co.	2,875	0	0
Jeffries	2,850	0	0
Pulsometer Company	2,400	0	0
RAINBOW ENGINEERING COMPANY (accepted)	2,300	0	0
Murdoch & Cameron	2,237	0	0
Bradford & Co.	2,090	0	0
Summerscales	1,650	0	0

Some explanation of what appears so unintelligible a proceeding cannot fail to be also of interest.

WROUGHT-IRON.

IN a lecture on this subject, given in the Mason College, Birmingham, the lecturer on metallurgy, Mr. T. Turner, after describing sundry details of furnace construction and the difficulties that are met with in endeavouring to determine the best form of furnace, described in detail the nature of the changes that take place during the purification of cast-iron in puddling. It was first mentioned by Price and Nicholson, in a patent granted in 1856, that when cast-iron was subjected to oxidising influences the silicon was almost entirely removed before the other impurities were to any considerable extent affected. Shortly afterwards, in 1858, Calvert and Johnson, in their well-known researches, determined some of the most important facts with regard to the removal of several of the other impurities. But though the sequence of the changes was thus made out the theoretical reasons underlying the changes was open to discussion for many years, and in some particulars is even yet unsettled. Arguing from analogy with what takes place in steel-making, it was suggested that the purest iron would give the largest yield and the best product, and that the changes were the result of the action of ferric oxide on the carbon and other impurities that were removed. The late Sir W. Siemens, in 1868, was the first to point out that the most active agent in the puddling furnace was the fluid magnetic oxide, which, owing to its fluid condition, can readily act on the molten iron and bring about the required changes. Too much ferric oxide leads to a thick slag, which is less active in its character, which is not so good to work and which leads to waste of metal by atmospheric action. But when the slag is of proper composition it both purifies the iron and "nourishes" it as well; that is, the slag supplies oxygen to remove the impurities, while in so doing the oxide is itself converted into metallic iron and added to the charge. It is therefore a mistake to regard the fluid slag as useless or harmful, and sufficient hammer slag or other cheap fusible fettling should be charged early in the process, so as to give what is required. A pig-iron with too much silicon or phosphorus gives bad results owing to excessive requirement of fettling, or what the puddler aptly calls its "hungry" character; but on the other hand, if the metal used is too pure, not only is the yield less, but the product is often red, short and inferior. An iron of intermediate quality is thus most suited for the use of the puddler, and in this fact lies one of the most important reasons which has led to the continuance of puddling in the face of

such formidable rivals. By means of a series of lantern-slides, prepared from photographs of the interior of the furnace during the progress of a charge, the nature of the changes that take place was rendered clear, and the audience was thus able to follow each step of the process from the preparation of the furnace after a previous charge to the rolling of the finished bloom of iron into a puddled bar.

LEICESTER MAIN DRAINAGE.

At a meeting of the Society of Engineers, held at the Town Hall, Westminster, on Monday evening, March 6, 1893, Mr. William Andrew McIntosh Valon, J.P., president, in the chair, a paper on "The Leicester Main Drainage, &c., and the Construction and Testing of the Sewage Pumping Engines and Boilers," was read by Mr. E. G. Mawbey, borough engineer.

The author having referred to the great prosperity which Leicester had enjoyed for many years past and the rapid increase of population, said that in the year 1891 an Act of Parliament was obtained for the extension of the borough boundaries, for which scheme he was the engineer. The population was now 180,000, and the area $8,534\frac{1}{2}$ acres, the rateable value being about 650,000*l*.

Both the gas and water undertakings belong to the Corporation, and Mr. Alfred Colson, M.Inst.C.E., is engineer and manager of the gas department, and Mr. Frederick Griffith, M.Inst.C.E., engineer and manager of the water department.

The Corporation has recently finished floods prevention works which have cost 352,000*l*. The drainage area (above Leicester) of the river which had been improved is 147 square miles. The new flood channel will carry off 400,000 cubic feet of water per minute, or $1\frac{3}{4}$ inches of rainfall in twenty-four hours. The length of the principal weir constructed was 500 feet. These works were for the most part designed and carried out by the late Mr. Joseph Gordon, M.Inst.C.E., and Mr. F. Griffith, M.Inst.C.E., but were completed and the new West Bridge designed by the author.

The flooding of the town, which in times past had been disastrous, was now entirely prevented within the boundaries of the old borough. The author stated that storm outfall works designed by himself were now being carried out, and that the contracts let amount to 71,447*l*. The main culvert is eight feet in diameter, and about three and three-quarter miles long, and would carry off about 70,000,000 gallons of water in twenty-four hours from the built-upon area of the extended borough.

The author said that about ten miles of new main intercepting brick sewers and storm outlets were being constructed in the borough which were designed by the late Mr. Gordon, and would, when completed, have cost about 105,000*l*. The sizes of the two main trunk sewers are 7 feet 3 inches by 6 feet 3 inches, and 5 feet 3 inches by 3 feet 6 inches respectively. Nearly one-third of these works were executed under Mr. Gordon's personal direction, and that the carrying out of the remainder, together with the preparation of the working drawings for rather more than half of these works, have devolved upon the author as the chief engineer. A further loan of 13,400*l*. has recently been sanctioned for additional sewerage works in the added areas according to the plans of the author. The sewage is treated on the system of broad irrigation. The total area of the farm is 1,700 acres, about 1,400 of which will be available for sewage, and are now being laid out and managed under the author's advice and direction. The total expenditure at present (exclusive of land) sanctioned was 58,900*l*.

The author gave a detailed description of the four independent rotative compound condensing beam engines, and the eight double-flued Lancashire steel boilers, each 30 feet by 7 feet, working at 80 lbs. pressure per square inch, for pumping sewage from the Leicester sewers to the Beaumont Leys Sewage Farm through two 33-inch cast-iron rising mains for a distance of about one and a half miles, and to a net height of 163.66 feet, which, together with the engine and boiler-houses, workshops and manager's house, cost 54,970*l*.

The following are some of the dimensions given:—

		Feet.	Inches.
Diameter of high-pressure cylinder	...	0	30
Stroke	...	5	$9\frac{1}{4}$
Diameter of low-pressure cylinder	...	0	48
Stroke	...	8	6

The author stated that to each engine there are two main sewage pumps of the piston and plunger type, one at each end of the beam, with a stroke of 5 feet $9\frac{1}{4}$ inches, the diameter of the piston being $27\frac{1}{4}$ inches. The suction of these pumps are single-acting and the deliveries double-acting, with flap-valves and very large waterways. The cast-iron fly-wheels weigh 21 tons each and the beams 15 tons each, formed of double steel flitches 2 inches thick and 6 feet deep at the centre. There were two steel air vessels, each 25 feet 9 inches high by 5 feet in diameter. The author then gave full particulars of the methods adopted in the official trials of these engines and boilers, which were drawn up and conducted by himself, and he

also gave in much detail the results of these trials, compared with the requirements of the specification, the averages of these results in a few of the principal items being as follows :—

	Lbs.
Consumption of coal per actual horse-power per hour in water lifted	1'915
Ditto per indicated horse-power per hour	1'712
Indicated horse-power per engine working at 12'051 revolutions per minute	199'63
Actual horse-power per engine in water lifted working at 12'051 revolutions per minute	178'47
Ditto in percentage of indicated horse-power	89'41
Duty in weight of water lifted per 112 lbs. of coal	115,913,333

Nixon's navigation Welsh coal was used.

The author explained that as these engines can be worked safely at about fifteen revolutions per minute, each of them is capable of developing well over 220 actual horse-power in water lifted. He stated that the engines and boilers were designed by the late Mr. Joseph Gordon, M.I.C.E., assisted by Mr. T. E. Laing, Assoc. M.I.C.E., and Messrs. Gimson & Co., of Leicester, were the makers, the manufacture and erection being done under the author's personal supervision as successor to Mr. Gordon when that gentleman was appointed chief engineer to the London County Council; that Mr. Stockdale Harrison, F.R.I.B.A., of Leicester, designed the buildings.

The total cost of carrying out the schemes he had mentioned would be nearly two-thirds of a million sterling.

The paper was well illustrated, and contained tables in considerable detail of the results of the trials.

ELECTRICITY IN FACTORIES.

ON Saturday Mr. Alexander Siemens, of the firm of Messrs. Siemens Bros. & Co., Woolwich, delivered a lecture on "Electricity as a Motor-power for Factories" before a large audience of the Birmingham Association of Mechanical Engineers. The simplicity of the construction of electrical machines, he said, was very marked, and that was the first point he brought before the notice of his audience. Then, again, little attention was required to look after such appliances as compared with machinery for other motive-powers. Allusion was made to two locomotives which had been constructed by Messrs. Siemens, and after they had each run 20,000 miles one

was inspected by Lord Kelvin, and the result was highly satisfactory. The first set of brushes were still in use, and to have a motor to run 20,000 miles, and, say, using only one pair of brushes per year, could not be considered serious. Sir William Siemens had proved the advantage of saving both expense and trouble by using an electric motor in his garden for pumping water in place of driving a steam-engine. Electric motors, besides being quite compact, were very light in weight, considering the power they exerted. There was no necessity for providing heavy foundations, as required when other powers were provided. The ideal way of applying any electric motor was that every machine-tool should get its electric motor, and so dispense with strong columns for buildings, and to avoid the use of shafting, counter-shafting, banding and pulleys, all these being a consideration on the capital outlay. He then referred to the alterations which had taken place at their works at Woolwich, where electricity has superseded steam at a saving of a considerable amount of space, of 800/. a year in wages, in addition to a large quantity of coal, which they must admit was a great consideration in maintenance. There were precautions necessary in using any electrical machine, and these he pointed out. In the transmission of power there was a saving by the adoption of electricity, as shown by a gentleman who read a paper before the Belgian Society of Engineers on the construction of the Small Arms Factory at Liège, which was a new place to be constructed. That gentleman went very carefully into the calculation as to what would be the best way of obtaining power, whether to have one or two steam engines, and then as to how to transmit the power, whether by shafting and belting, by ropes or electricity. The results were that with electricity he was sure he could count on 70 per cent. of the indicated horse-power being rendered at the machines, and with the shafting he could not possibly get more than about 60 or 63 per cent. Therefore in that respect the electricity was decidedly superior to the other method of transmission. By the establishment of central stations, small works could obtain electric power; they would then be able to have the facility of being placed much more on the footing of large works, as far as their source of power was concerned, but as to how that system would develop it was very difficult to foretell. It was quite certain that electrical motors for industrial purposes generally would make a lasting impression, and that they were of the greatest possible importance for the future development of their industries. A discussion followed the reading of the paper.

DUNDEE AND DISTRICT MASTER BUILDERS' ASSOCIATION.

THE annual dinner of the above Association was held in the Queen's Hotel, Dundee. After dinner the loyal and patriotic toasts were duly honoured. Mr. Stewart, Glasgow, submitted "The Lord Provost, Magistrates and City Council of Dundee." He remarked that Dundee had always been noted for the perseverance of its inhabitants, and he thought the city during the past fifty years had been very happy in the choice of its public men. Ground had risen from 300 to 500 per cent. in value, so that now it was very difficult to get a little patch of ground to carry on a modest business. Concluding, Mr. Stewart alluded to the beautiful situation of Dundee, and said it was frequently envied by Glasgow. Ex-Bailie Stuart, with whose name the toast was associated, replied. He remarked that Dundee had made both the worst and the best of its situation, and in all cases the wishes of the builders had to be given effect to. When they talked about builders they included architects and painters, and no doubt there was many a bad job covered by paint. Dundee builders knew a good deal about sanitary science in name, although he was afraid they did not know it very well by sight, but when they did life would be worth living. Regarding Lord Provost Mathewson, he felt that when he had laid aside the reins of office he would have left as great a fund of respect behind him as any man who had held the office before him, while the magistrates and council did the best they could, and if there were any axes to grind he had not counted them, but he did not think there were many. Convener Paul afterwards proposed the toast of the evening, "The Building Trades." He said that in all they did the Dundee builders were determined to give first-class work, work that would stand the test for a long time. They had only to look at the beautiful streets of the city as evidences of this, the buildings in many instances being superior to those in Glasgow. For some time past the building trade had been very dull, but he hoped the community would have the builders kept busy in the near future. Many people had adopted the foolish idea of investing their money abroad, with the result that they had the misfortune to leave it there, but he thought the tendency in the future would be for these parties to invest their money in stone and lime, and in

that event there would be no chance of their money running away. It would always be the aim of the firm he represented to forward the interest of the builders and to spread the contracts amongst them as equally as possible. He hoped the building trades of the city would have a successful future before them, and he was sure it had been a good thing for the masters to have been formed into such an influential Association as that which brought them together that evening—an Association that had been instituted not only in the interests of the masters, but also in the interests of the employes. He was sure the employes' Association recognised the great advantage derived from the masters' Association. The relations between the two Associations had always been most cordial, and as time went on he had no doubt they would continue to grow in strength and prosperity. The Chairman said the building trade was a most important branch of the local industries having regard to the number of workmen employed. When one looked at the changes effected in the city during the past few years in the matter of streets, buildings, &c., he must admit that the builders had had a fair share of the process of improvements, and much credit was due to the contractors for these improvements. For several years back the building trades had had a good share of prosperity, although at the moment things did not look so bright. At the same time they hoped that as the season advanced contracts would be plentiful, and that they would all be kept busy. At present contract prices were as low as they could be, and left a very small margin of profit, and he did not think there was likely to be much improvement in that direction for some time to come. Proceeding, the Chairman said that the Joint Association of the masters and men had been a great success as a board of arbitration. It had obtained the loyal co-operation of the men, and they hoped that state of matters would long continue. On the eight hours' question, the Chairman said that while it was good in its intention it would have to be approached with great caution, and foreign competition would have to be taken into account. Mr. P. Sim and Mr. Mackison replied, remarking that the builders of Dundee had been characterised in their business relations with enthusiasm and enterprise. Mr. A. Duncan gave "Representatives from Other Cities," and Mr. Heron, Edinburgh, returned thanks; Mr. Alexander, "The Timber Trade," Mr. James Bell replying; Mr. W. Bennett, "The Quartermasters," Mr. James Morrison replying. The other toasts were "The Clergy," "The Ladies," "The Chairman" and "The Croupiers."

REGISTRATION OF PLUMBERS.

THE Deputy Mayor of Cork presided at a public meeting held at the Cork School of Art, under the auspices of the Munster District Council for the National Registration of Plumbers. There was a large and representative attendance of plumbers, the medical profession, and the Corporation of Cork. Mr. W. Kaye Parry, M.A., B.E., honorary secretary to the Dublin District Council, delivered a lengthy and interesting lecture, entitled "The Seamy Side of Home, Sweet Home," in the course of which he laid great stress on the necessity for perfection in all matters connected with domestic sanitation. He said he desired to direct the particular attention of all householders to the two following points. (1) That children are particularly liable to succumb to the malign influence of sewer gas and impure drink and food; and (2) That while persons may become reconciled to their environment and can exist in dangerous houses to which they have become inured, those who have been accustomed to healthy houses are very liable to contract disease if they move into unhealthy houses. He had personally inspected more than 1,500 buildings, and hundreds of cases of sickness had been directly traced by himself to defects in drainage and plumbing and water pollution.

THE PLATE-GLASS INDUSTRY IN AUSTRIA.

THE United States consular officials in Vienna and Prague have sent reports to their Government on the plate and mirror-glass industries of Austria. It seems for two centuries the mirror-glass industry has been established in Bohemia, just across the Bavarian border, where the surrounding forests guaranteed a plentiful and cheap supply of fuel. At first glass for beads and bottles only was produced. In the latter half of the last century Bohemia held the first place amongst the glass-producing countries of the world; the value of the glass manufactured there in 1799 amounted to about a quarter of a million sterling. Early in this century, however, the markets began to be flooded with cheap English and French pressed crystal glass, with which Bohemian glass could not compete, and, notwithstanding the efforts of Bohemian glass manufacturers, the decline of the industry was inevitable. In recent years it has revived, and there are now in Bohemia about 150 glass works and nearly 3,000 grinding establishments, employing nearly 30,000 persons. There are a number of glass works in other Austrian provinces, and in Hungary there are over 70 in operation. The

chief factories for producing plate and mirror-glass are situated near Pilsen, in Bohemia. The value of these kinds of glass depends on the purity, and the greatest possible care is therefore taken to procure materials of the very best quality, and almost every manufacturer guards the formula of his own special mixture as a trade secret. The substances used, though the proportions differ, are quartz, purified potash, hydrate of lime or marble, saltpetre, arsenic, manganese and smalt. The reports enter into numerous details of the various processes of manufacture—blowing, rolling, grinding, smoothing and polishing.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

3680. John MacDonald, for "Improvements in domestic fire-grates."

3727. George White, for "Improvements in windows, window-sashes and window-frames."

3753. Alfred Julius Boulton, for "Improvements in safety-mechanism for hoists, lifts and the like."

3806. George Barker, for "Improvements in stoves and furnaces."

3807. Thomas Henry Ackroyd and Messrs. Willoughby & Co., for "Improvements in the method of and in apparatus for consuming smoke."

3820. John Marion Morgan, E. B. Neave, S. H. Wiley and W. Smithdeal, for "An improved filter."

3839. William Gunter, for "Improvements in cocks or taps, and in levers controlling the same."

3935. Robert Brown, for "Improvements in or pertaining to lock followers."

3938. Frank L. Voegtly, for "Improvements relating to fire-grates."

3914. James Allen, for "Improvements in plumb-levels and analogous instruments."

THE BLACKMAN VENTILATING CO., LTD.

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.
All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

Head Office:—63 FORE STREET, LONDON, E.C. Branches at MANCHESTER, BRADFORD, BRISTOL and GLASGOW.

HARDAKER, Electrographer, 21 Cursitor Street, E.C.

ROYAL AGRICULTURAL HALL, LONDON.

ELEVENTH ANNUAL BUILDING EXHIBITION

Of all Industries connected with the Building Trades,

MARCH 11 to 25, 1893.

"THE ARCHITECT" says of the 1892 Exhibition:—

The representatives of all industries connected with the building trades will be wise to commence at once their preparations for the Exhibition. There cannot be as loud a preliminary flourish about an Exhibition in Islington as there is always about one of those designated as "International"; but if exhibitors will consider the results of the two classes, they will discover that in the former they have met men of business and received orders, while for the privilege of participating in the universal shows they have not only lost large sums, but discovered that the dilettanti and holiday makers, who constitute the mass of visitors, are not fascinated by the best aids to construction."

JOHN BLACK, Secretary.

Exhibition Offices: 2 Newcastle Street, Strand.

QUANTITIES, &c., LITHOGRAPHED

THE BUILDING EXHIBITION.

THE Building Trades Exhibition opened on Saturday, the 11th inst. The exhibits deserve the attention of architects and builders and all who are connected with building operations, for although they are not as numerous as on other occasions, perhaps, nearly in every case what is shown is of more than usual interest, due to the firms whose reputations have been made by good workmanship, and who more than sustain that reputation by the high standard of excellence to be seen in the objects and appliances arranged at the various stands. Many exhibitors cannot be spoken of, as their contribution to the show this week has been confined to raising dust in the building and preventing conversation by the noise of continual hammering.

Barnard, Bishop & Barnards, Limited.

This is one of the finest exhibits that has been seen at a building exhibition in the Agricultural Hall, and deserves

GRINNELL

The Sensitive Automatic

GRINNELL SPRINKLERS are at present protecting 15,000 Buildings in all parts of the World, including Theatres, Shops, Warehouses, &c.

1,300 FIRES have been Extinguished by the GRINNELL at an average loss of **£55 PER FIRE.**

VOLUME XLVIII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.
OFFICE: 175 STRAND, W.C.

recognition also in regard of the practical utility of the appliances shown, and which, according to their class, are to be seen also under the most pleasing aspects when ornamental effect is desirable or requisite. Among the appliances shown is a beautiful range that any cook might be proud of possessing. It incorporates all the improvements that the experience of years has developed. It can be used as open or closed fire as required, and the arrangement for lifting the fire—it can be raised to any height from the bottom—is invaluable as regards economy of consumption of fuel altogether, and enabling cooking or heating operations to be performed quickly and without waiting for the resurrection of a low fire that otherwise has to be rekindled by the deadening process of recharging it with fuel.

One of the firm's latest patent stoves is shown encased with exquisite taste in walnut wood chimneypiece and overmantel. It is a slow-combustion stove, with fire-brick back with perforated bottom, and regulator ventilation arrangement. Another fine specimen of work is a dog-stove and irons of wrought-iron in large chimney or dog-opening, the effect of the walnut mantelpiece being enhanced by colour and design of the tile lining. Among the other handsome slow-combustion stoves a patent one (Wm. Vyse's) shows a good sample of the effect of tilework, as it is judiciously introduced in combination with plain enamelled wood mantel. Another handsome stove in brasswork is fitted in mahogany chimneypiece, a feature in the latter being the rich blue cloisonné enamel inlay-plaques. The Dutch figure-work in blue of the tile slabs shown in another dog-opening attracts attention, as it creates a pretty effect in combination with the wrought-iron dog-grate worked out in simple treatment. Among other types of slow-combustion stoves the "Norfolk" patent slow-combustion stove is well mounted in a fine walnut-wood mantelpiece, with ornamental tile jambs. The one enriched with brass and figure-work is worth notice for itself, as well as in connection with the tile treatment, the pictorial panels in tilework being executed in sepia, which imparts richness to the landscape effects delineated. There is much to admire in the specimens of ornamental wrought-ironwork shown. Among this class of work is included work for lamps, wall-brackets, standards, hanging lamps, &c., which, as shown, fitted with lamps and glasses, shades, &c., produce a telling effect. The sample shown of a register for small rooms should be made mention of. Small registers are too often useless; after much lighting to make the fuel they burn create a draught, they will not radiate heat, but, to

judge from the construction of the above-named registers for small rooms, these undesirable conditions will be found to be reversed. The slow-combustion stoves, which may be had for all purposes and to suit all requirements from Messrs. Barnard, Bishop & Barnards, of the Norfolk Ironworks, Norwich, have all practical merits to recommend them for use, if a maximum of heat with the minimum consumption of fuel, combined with cleanliness from dust, obviation of smoky chimneys, and the capability of keeping at work with little attention while at work, are to be considered advantages. We would recommend a personal inspection of the exhibit to our readers when visiting the Hall.

Alfred T. S. Carter.

A large and pleasing assortment of tile work is shown by Mr. Alfred T. S. Carter, of the Tile and Mosaic Works, Brockley, including tilework for all purposes, architectural faience, marble mosaic work, ceramic mosaic for flooring, &c. One feature of the exhibit to be noticed is that all the tilework has been set in cement, thus enabling architects and builders to judge of the constructive qualities of the materials. Tiles are shown, encaustic, glazed, enamelled, embossed, hand-painted and other tiles, all these for walls, floors, &c., respectively. Some entirely new and pictorial designs are shown in tilework suitable for butchers' establishments, dairies and the like, dairy and other subjects being depicted. There is so much, however, that is new that an inspection of the actual exhibit is necessary, as only a few salient features can be mentioned here. The architectural faience includes fine majolica pilasters, capitals, cornices, friezes, architraves, &c., in good designs and correct style, and may be seen extensively used in hotels, restaurants, public-houses, &c. A variety of fine tiled hearths are shown, with a series of glazed tile fender curbs. A novelty of a desirable nature is seen in the curbs, which are formed of whole lengths of tile instead of being a number of short lengths cemented together. A tile treatment for dairy walls in panels is quite new in regard of colours. The effect is extremely good, but this is shown for the first time. A drawing-room table in glass mosaic is rich in colour, with red, white, gold and blue. The White Horse of Kent is depicted in glazed mosaic, and an emblem familiar to students of Winchester College is said to be the smallest figure in this country worked in marble mosaic. A specimen of glass mosaic for church decoration showing a saint has only just been completed. The floor mosaics include hand-placed marble

tesseræ and granite marble mosaic forming an economical flooring material.

Merryweather & Sons, Limited.

An exhibit that strikes the eye of a visitor on entering the hall is that of Messrs. Merryweather & Sons, Limited, hydraulic engineers, 63 Long Acre, W.C., and Greenwich Road, S.E. In addition to the general exhibit, it will be found that much care has been taken by the management to include many minor details which are of interest, which we do not pretend to allude to in this short paragraph. It may be mentioned, however, that all classes of appliances for fire-extinguishing are shown, and the character of the materials and the workmanship should be noticed; these appliances regard safety to life and limb, and workmanship and all else is of the very best. Cheap imitations would prove worthless in action and augment loss of property and life. One appliance directly inviting the attention of architects, engineers, &c., of builders and contractors, is a portable steam pumping-engine, "The Valiant," a slightly detailed description of which should be of interest. Taking into account the small size of the engine—that a man can wheel it from one place to another, and that dismantled from the wheels it is an easy task for four men to carry it off bodily—its forcing power seems altogether in excess of what could be expected, not to mention the quick steam-raising power of the boiler to which the pump is attached; the boiler being of the Merryweather type of quick steam raising, which raises steam from cold water in seven minutes from the kindling of the fire. As to force, the capacity ranges as required by circumstances from 80 to 120 gallons per minute, with a power to deliver water as a fire-jet through 90 feet of hose to a height of 30 feet. This little engine, it appears, will deliver water through three miles of hose, and on estates, farms, &c., for irrigation and other purposes is found most valuable. It is used by water-engineers for washing out reservoirs, cleansing gravel, &c. It has been supplied in large numbers to builders and contractors who require the services of a powerful but portable pump to get rid of water during excavations. Its use is also recommended to borough engineers and surveyors for use at sewage works, getting rid of flood-waters, &c. It is used in connection, moreover, with the Merryweather hydraulic sewer-flusher, an operation which was described some time since in *The Architect* as witnessed in Leicester Square. Among other places, one is in use by the Vestry of Mile End Old Town. One was also used in cutting

the ditches and canals for the Hague Waterworks. A large assortment of fire-extinguishing plant is exhibited for protecting private mansions, public buildings, mills, warehouses, &c., from fire. An especially useful article that may be named is the London Brigade hand-pump, that throws a jet of water 50 feet from the nozzle. It is estimated that more than half the outbreaks of fire in London are stopped by this little appliance. The "Chute" fire-escape, made of specially woven canvas, is a simple and effective appliance. When required it is fixed at once to a window, and the long canvas tube unrolls simultaneously to the ground. The "Chute" can be adapted to any window, and it meets the requirements of the new factory Act. An assortment of ground hydrants, stand-pipes, &c., for protection of towns from fire is shown; also a large amount of hose (the sphincter grip-armoured hose), which is practically indestructible, being protected by galvanised steel wire. It is invaluable for builders' use for conducting water to all parts of the work during building operations. All information respecting the Merryweather specialties can be obtained from Mr. J. Batcheler, under whose management the exhibit is. A novelty that may be mentioned is the decoration of fire-buckets, showing the coat-of-arms of any special company or brigade.

Wilson Engineering Company, Limited.

Among the excellent specialties shown by the Wilson Engineering Company, Limited, of 227 High Holborn, is a monster gas-roaster, capable of roasting an ox whole. Gas-ovens for cooking pastry and requiring sharp heat are shown, also gas hot-closets with cutting-dish combined, for use with either gas or steam; gas-cookers, a feature of these being that no gas can enter the ovens; potato-steamers for large hotels capable of cooking three bushels at a time; also a specialty in the way of a coke-grill for large hotels, restaurants, &c., fitted with tiles, and having hot-closets, &c. There is a representative assortment of the Wilson ranges in different sizes and to suit all requirements, and which now are all fitted with rising fire arrangement and can be used for open or close fire. One shown is specially suitable for coffee-houses, having two large and very hot ovens and a boiler-capacity of ten gallons. All kinds of sanitary appliances are shown, such as have to withstand traffic. Manhole covers, gratings, &c., some in galvanised iron and others in cast-iron, are extremely durable. All the work, cast and figured as well, was manufactured at the foundry and works in Goswell Road.

BARNARD, BISHOP & BARNARDS, L^{IM}.

INVENTORS AND ORIGINAL MANUFACTURERS OF

SLOW COMBUSTION OR "NORWICH" STOVES,

Otherwise known as the "Country Parson's" Fire Grates.

An inspection of our Stoves, Ranges, Mantels, Curbs, and other accessories at the Building Exhibition, Agricultural Hall, Islington, is earnestly solicited.

Architects should specify for the new Triple-Pipe "UNION," "ROYAL UNION," and "CHAMPION UNION" patterns DIRECT RADIATORS, giving more easy, uniform and positive circulation of Water or Steam; also Walworth's Patent Wrought Tube Steam Radiators.

The Largest Stock of American Steam and Water Fittings, Valves, Tools, &c. &c.

Turpin's Parquet Floor, Joinery and Wood-carving Company, Limited.

As on many previous occasions a beautiful display of the ornamental wood-carving and parquetry is on view at the stand of this company, the whole of the exhibits having for background a magnificent carved chimney-piece overmantel, &c., suitable for a banquetting-hall. The patterns in wood-parquetry and marble mosaic are varied, and show that there is a wide margin of choice available in working out any desired scheme of decoration. The managing director, Mr. M. T. C. Turpin, aided by a most competent staff trained under him, has steadily improved the manufacture of the company's specialties, and he has lately patented a new system of constructing wood-block floors, which has been pronounced by some expert authorities as the best of known modes of interlocking wood floor-blocks.

King & Smith.

Messrs. King & Smith, Stowe Works, Weedon (London office, 59 Haymarket), show their patent honeycomb wine-bin. The construction of this wine-bin is altogether a novelty. Each receptacle for a bottle is a separate tube, made of terra-cotta, hexagon or honeycomb shape outside and circular within, just large enough to take a bottle easily. In new buildings they can be built in the walls, thus making the cellar 1 foot larger each way. Crushing strains can be had. The tubes are stacked in honeycomb fashion in any space desired to be fitted up as a wine-bin, and require no kind of fixing, as they fit into each other, and from ten to twelve tubes go to 1 square foot of wall-surface. The advantages claimed for this system are:—Simplicity and cheapness. The great number of bottles that can be stored in a given space and their adaptability to spaces of irregular form and odd corners. Each bottle having a separate chamber is protected from currents of air and sudden changes of temperature, and the breakage of one bottle cannot affect any other. The tubes (little larger than a bottle) can be handed down awkward cellar stairs down which framed racks would not pass. Being porous, the tubes will absorb water sprinkled over them, and the evaporation that ensues will materially reduce the temperature, so that where wines and aerated waters are required to be kept cool the patent "Honeycomb" wine-bin becomes a simple and ready form of refrigerator when so treated. Unless otherwise ordered, the tubes are made to suit ordinary wine bottles, and will, of course, do for smaller sizes, but they can be supplied to suit bottles of any size.

Baillie & Lutwyche.

The art of decorating glass and tiles by means of vitreous enamel in relief seems to have made great advancement both in the material and designs, as exhibited by Messrs. Baillie & Lutwyche, whose ateliers are at 19 Goulton Road, Lower Clapton, N.E., Stand 66. A glass ceiling effect with enamelled star centre is shown, also an inside skylight (the ornament turquoise and gold) has almost a better effect by artificial light than by daylight, and does away with the dreary blankness of plain or stained-glass. A black and gold ornamental panel is good. There is also the old willow-pattern plate—a most effective and peculiar treatment in blues and whites—an Italian Renaissance panel, and a fish and water panel. These are decidedly worth notice; also a Japanese blind. A bunch of orchids is remarkably effective, both as regards the modelling and shading. There seems to be no limit to the usefulness of this work, and as the enamel, being a glass itself, is fired into the glass it becomes quite permanent. It needs only to be seen to be appreciated. We understand extensive work has been executed for Germany, France, the West Indies, Ireland, and in this country, but we have seen little of it in London. We strongly advise a personal inspection to be made of this exceedingly interesting exhibit. The glass and tile work, it should be mentioned, show by reflected light and transmitted light, therefore by night as well as by day.

St. Pancras Ironworks Company.

This company's exhibits are characterised as usual by high class workmanship. Varieties of ornamental iron staircases, including spirals, are shown, also their well-known improved stable fittings. Pavement lights, coal plates, &c., and a large assortment of lenses are shown, also the balanced cellar-flaps, in combination with a stall-board for warehouse purposes, the appearance being of a graceful character, and in it for purposes of ventilation a hopper opening has been ingeniously introduced.

T. S. Knight.

The exhibit of Mr. T. S. Knight, 222 Great Portland Street, is an attractive one. A range is shown which may be described as a combination of the Yorkshire and Leamington principle. One of the ovens is called the patent collapsible. With two movements the oven disappears, and then the whole of the hot-plate is available for boiling purposes. The range is for open or close fire, as desired; and the patent lifting fire arrangement secures some 50 per cent. reduction in regard of con-

sumption of fuel. Another feature is the cinder-sifter, which catches fallen fuel and riddles the cinders when they can be, so to speak, reburnt. In economy of fuel it is considered that this range supersedes all other ranges. The apparatus has secured gold and silver medals at various exhibitions. In addition to side boiler containing nine gallons there is a circulating back boiler for sixty gallons. This is shown in working order in combination with a copper cylinder which in twenty minutes will supply water hot enough for an ordinary bath. Russell's patent "Tit-bit" stove is exhibited. Connected with it is a peculiar feature, which cannot fail to be of use to numbers of persons, applicable to breakfast or dining rooms, as also for nurseries. The canopy of the stove is utilised, and practically forms, when required, an oven, in which toast or other warmed articles can be kept warm in case of necessity. The principle is that of the duplex Waverley, so much favoured both in London and in the provinces. The whole appliance is handsomely shown with tiled sides, chimney-piece, &c., tiled hearth and brass curb, all in character. Another of the Russell patent stoves has two qualities to distinguish it from any other in the market. According to the regulation of the canopy, drawing it forward or pushing it back, an aperture at the back is accordingly opened or contracted, allowing free passage for smoke, a movable valve or damper being attached to bottom of canopy for closing when the fire is not in use. The second feature is that the canopy can be converted at will into a blower, and in case of chimneys liable to smoke this would prove a thorough preventative. This is exhibited for the first time. This stove also is made on the duplex Waverley principle, neatly arranged throughout and having tiled hearth and brass fender curb. The adjustable grill (on rackwork) shown, we should mention, will prove an invaluable adjunct to any range.

J. M. Bennett & Sons.

The present opportunity of seeing the beautiful work obtainable by the use of "Goehring," the correct pronunciation of which is as in that of the word "gearing," should not be missed by visitors, still less by practical business persons, as the artistic and useful capabilities of this process of using natural and everyday materials, as shown, must commend itself to all. The exhibit shows the wide range open to a decorator by use of geometrical mouldings which are cut out of solid woods of nearly every kind. The beauty of prized woods needs no explanation, and the process is not confined to ordinary woods,

and so style and design are not limited in that direction. Something of a novelty is seen in wavy-moulded work, which is so accurately worked that the tongue and groove joints are absolutely undistinguishable, and it must be noticed that the tongue and groove are worked in wave and not on the straight. It would therefore appear that those who use matchings, and perhaps, have to make them, will obtain great advantage by using Bennett's Glen Cove Standard Gauges, as they ensure that any of a thickness will match without any extra labour in easing the tongue, a difficulty which our readers will readily appreciate. At the exhibition Goehring moulds are shown in furniture, shop and office fittings, internal decoration, constructional and dado work, picture frames, &c. The sole manufacturers in the United Kingdom are Messrs. J. M. Bennett & Sons, timber merchants, Manchester, and Suffolk House, 5 Laurence Pountney Hill, Cannon Street, London, E.C. In a previous issue we gave an illustrated description of "Goehring," to which we refer our readers, while at the same time we advise them "to go and see for themselves."

Cork Pavement Company, Limited.

This company, 7 Great St. Helen's, E.C. (works at Creek's Mouth, Barking), show their patent cork pavement, which possesses the following advantages, viz.:—Secure foothold for horses or pedestrians in any weather, and forms a perfect roadway: extreme durability at a very moderate cost; a perfect preventative of noise; a non-absorbent, inodorous sanitary roadway, unaffected by variations of the weather or temperature; the cork bricks can be made of various sizes and thicknesses, to suit all purposes as may be required. It is also admirably suited (and is now being extensively used) where dry, warm and sanitary floorings are required for such purposes as railway station platforms, subways, footways, carriage drives, stables, stable-yards, coach-houses, loose boxes, kennels, drill-halls, church aisles, magazine floors, exhibition floors, tennis courts, bicycle and running tracks, &c. Nothing need be said to recommend the cork pavement. It is, we believe, a compound of cork and bitumen, and may be called a sanitary material, both directly and indirectly. Indirectly, being noiseless, the nerves of many can be saved from suffering; also in stables, kennels, &c., it may be said to give rest and comfort to animals, somewhat akin to the comfort of sleeping oneself on a good bed instead of a hard board. The elastic properties of cork pavement will readily explain this and account for extra durability and wearing qualities. It is not

necessary, however, to say more, for many who are not likely to adopt the system without good reason have done so, and are pleased with the results. As prominent persons and Government—or, perhaps, we should say, military authorities—have recognised the merits of cork pavement, it may not be too much for the company to expect that the use of the material will be promoted by those charged with keeping in order the carriage-ways of our towns. Among the places where the pavement is laid are the following:—At the Watch House Battery, Citadel, Plymouth; H.M. Prison, Holloway; Life Guards, Knightsbridge; Raleigh Club, Regent Street; Tattersalls; Pickford & Co., both in London and Croydon, &c. On the particularly steep gradient under the Great Eastern Railway Hotel it has been laid, with marked success as the result; also in Deptford Road, to order of the Greenwich Board of Works, where the traffic is enormous, and this to the benefit of the frequenters of the church. The Caledonian Railway, Princes Street, Edinburgh, have adopted it, the Great Western Railway, &c., and the Aylesbury Dairy Company and many private owners also have made use of the pavement. Also the Master of the Cleveland Hounds, Mr. Wharton, Mr. Lloyd Price, Master of Herries, Mr. Athol Hay, who considers his stables show the best paving in Scotland. For kennels and stables it appears to be most suitable, and in stables economical as regards straw compared with the consumption of equine bedding where other paving is used, and in kennels useful in keeping off kennel lameness.

Joseph Robinson & Co., Limited.

Messrs. Joseph Robinson & Co., Limited, of 206 Phoenix Street, Somers Town, N.W., manufacturers of plaster of Paris, Keene's, Parian and Martin's cements, also of Robinson's fireproof cement, show their system of plastering, and they have afforded visitors to the Hall the facilities of seeing the work actually carried out. We have described before the peculiar merits of the fireproof cementing and plastering, which it must be understood is for interior use. The exquisite surface obtained for walls, &c., rivals that of marble, and shortly after the plastering is completed the wall is dry and ready for any other treatment required, painting, &c. The putting on the plaster is also done in far less time than by old-fashioned methods, and therefore there is a distinct economy in cost and saving of time and labour. We may repeat what we said on another occasion, that Captain Shaw highly approved of Robinson's cement as a protection against the spread of fire.

The whole of the work at the stand of Messrs. Robinson has been carried out by the Fireproof Cementing and Plastering Company, of Westminster Chambers, 13 Victoria Street, S.W.

Duff & Spagnoletti.

Messrs. Duff & Spagnoletti, of the Hogarth Studios, Charlotte Street, Fitzroy Square, show fine examples of their beautiful work in stained-glass for ecclesiastical and domestic purposes, and also a large number of beautifully-designed windows that they have carried out. There is a fine east window for a church in Coleraine, "Christ blessing His Disciples;" also windows for the church of St. James, Belfast; Balaklava Church, Melbourne, and one for Downpatrick Cathedral, "Charitas." A curious and fine effect of colour is seen in a small work representing Touchstone and Audrey from "As You Like It." A fine classical figure in another work represents "Music," and some beautiful samples of heavily-coloured glass representing various subjects are also shown. They execute all classes of stained glass, from the plain geometrical glazing to the richest church figure-work; and while their prices will be found to compare favourably with other firms, they guarantee the best drawing, harmony of colour and general workmanship.

Fryer's Patent Cows.

Fryer's patent cows are shown at the stand of Mr. Walter Monnery, of 69 Southwark Bridge Road. Among the advantages claimed are the following:—That they are a cure for down-draught under all circumstances; have a square base which gradually tapers off towards the head; cause no choke to the smoke as round base cows; that the inlets, which are bonnetted over, are so arranged on the four sides of the base that the outer current is drawn upward, causing about 100 per cent. greater up-draught; noiseless at work; bearings move in oil; no friction; revolves in the slightest current; it has an open head, which allows the smoke to issue freely; there is no obstruction to the sweep-brush, and they can be swept as easily as a chimney-pot; the tubular upright shaft holds a supply of oil for years; the bearings are covered over with a brass collar which renders them perfectly dirt- and dust-proof; the head cannot blow off in a storm; the wings of the cowl-head are kept in position by two strong circular wire stays; the hinge-flap on top of head provides easy access to the bearings; they are strongly made of galvanised steel sheets; no seams; no

solder; all parts being rivetted, which renders them perfectly fire-proof; a snowstorm does not impede their action and they are the only cowl which will revolve in a fog.

Joseph Kaye & Sons, Limited.

The specialties of Messrs. Joseph Kaye & Sons, Limited, always form an attractive feature at the Building Trades Exhibition. We have before now alluded to the useful appliances that seem easy to Mr. Kaye to invent for any purpose, particularly in regard of door appliances, locks, &c., of every kind. One among the many interesting inventions is the railway lock we have described on a former occasion, and which is now shown at the Hall with a new and most ingenious as well as practically useful addendum in the shape of a covering-flap for the inside of carriages. This is, however, easily lifted, and then the mechanism is at once ready to the hand to open the door. It is Kaye's patent automatic wedge lock, the form being somewhat modified to suit railway carriages, private carriages, broughams, &c. It is a favourite with those who have tried it for ease in opening and closing doors, preventing settling, and general safety. The durability and immunity from broken parts, handles, &c., is also to be considered. The lock shown at the Hall has been opened and shut about a million times without showing wear. Outside Mr. Kaye's establishment in High Holborn every boy that passes opens and shuts the door which is invitingly placed within reach of the passers-by. Hence the number of times the lock has been opened. The Prince of Wales, Lord Suffield, and others of the nobility have adopted the lock for their broughams. Kaye's patent door-ports are a most useful invention, and should be inspected along with the rest of the appliances shown. Mr. Kaye, the inventor, is in constant attendance himself, and thoroughly explains the various useful locks, &c., which form the attraction of his exhibit.

E. S. Hindley.

Mr. E. S. Hindley, of Bourton, Dorset, shows his excellent vertical and horizontal steam-engines, also a horizontal steam-engine in combination with a vertical boiler, one of Hindley's well-known vertical boilers, both being mounted on a substantial water-tank requiring no brick foundation. The boilers have been recently greatly increased in size, the fittings and mountings being of a superior quality. Every boiler is proved to 150 lbs. per square inch, and every engine is well tested under steam before leaving the works. These engines combine

many improvements not usually found in those of moderate price. The bed-plate, crank-shaft bearings and guide are all cast together in one piece; the cross-head and slipper have extra large wearing surfaces, and are adjustable. The cylinder is neatly lagged with polished mahogany and brass bands. The feed-pump is of improved construction, and will use water almost boiling. The fly-wheel is wide, and is turned for a belt; it can be placed on either side of the engine, the crank-shaft being long enough to carry a pulley at the other side. The variable expansion gear affords a valuable means of adapting the power of the engine to the exact amount of work to be done, and thus conduces to economy in fuel. The governor is of the high speed equilibrium class, and has been found to give an exceedingly uniform motion to the engine, even under considerable and sudden variations of work; it is adjustable while running, hence this engine has been much approved for electric light purposes. All parts being made to template, gun-metal bearings, &c., can be replaced with new ones when necessary without the assistance of a mechanic, the seats or carriages for the bearings being bored to receive them, and the bearings themselves being turned externally. Condensers can be added to engines of 10 horse-power and upwards.

Robert Adams.

The well-known specialties of Mr. Robert Adams, of 67 Newington Causeway, are to be seen at his stand in the exhibition at the Royal Agricultural Hall. Those visiting the exhibition will be repaid by examining them and seeing them in practical work. To mention some among the excellent inventions which Mr. Robert Adams has spared no trouble to put in reach of the public as effective appliances at the most reasonable prices, among those that may be mentioned are Robert Adams's new patent spring hinges, including the Crown Victor double action spring hinges, which open wider than any other and close the door with absolute silence from the angle of 135 degrees; that is, 45 degrees wider than ordinary hinges. Also the London Victor single action spring hinge, which opens wide back—to nearly 90 degrees wider than others—and closes the door with absolute silence. These are guaranteed to be the most durable spring hinges in the market, invaluable for banks, &c., for hard wear and rough usage. Robert Adams's new patent combined door-spring, set opener, and silent check is a spring more especially (but not exclusively) designed for public-house doors. It sets the door open at the angle desired,

thus dispensing with the leather straps and lancewood springs, and closes the door with absolute silence. Robert Adams's patent Empress Victor door-spring, with all latest improvements, can be fixed inside or outside of the door, either right or left hand side, by means of the universal fittings, and is the only spring possessing this advantage. It also closes the door with absolute silence. Robert Adams's patent Queen Victor single action floor-spring with silent check action; also his patent hurricane Victor double action spring hinge, also with silent check, are shown. Attention should also be called to Robert Adams's patent fan openers, link motion. These openers have been specially designed to be universally appli-

cable for fanlights on hinges or pivots, easily fixed, neat in appearance, with screw rod action. The movement is smooth and noiseless, and the sash is locked wherever the handle is left. Also shown is Robert Adams's side gusset draught preventer, composed of metal plates, which fold up on the face of fan and frame. It is durable, efficient and neat. Also numerous other fanlight and skylight openers to suit every conceivable light, and special gearing for opening ranges of sashes of any size. Also Robert Adams's patent triple action casement bolts, ornamental or plain; and these bolts are greatly appreciated for their utility, strength, and superior appearance. The patent tongued casement bolt excludes all weather and draught, and forms a dead-lock. There are also other specialities in the way of bolts for entrance gates, &c.

Walter Monnery & Co.

It is needless to write that the well-known wall-ties, for the production of which Mr. Monnery has been so long celebrated, are exhibited in large numbers and great variety at this stand. But there is also a large display of other specialties selected from the stock at 69 Southwark Street, S.E., which are interesting and instructive to architects and builders. There are some extremely handsome tiled register stoves, with ornamental chimneypieces of various descriptions. Messrs. Monnery are agents for Fryer's ventilating appliances and patent chimney-cowls. It is only necessary to examine this exhibit to discover at once that both the ventilators and the cowls are economical and effective. A very ingenious invention is also to be seen, which is for the use of plumbers, and removes all the well-known difficulties which so frequently arise in the bending of pipes.

Randall Hardened Stone Co.

The Randall Hardened Stone Company show the application of their building solution to the hardening of stone, lime, mortar, &c. Its advantages in obviating all hindrance to brickwork in winter, and converting a soft stone into a hard one, ready to be polished, are inestimable, and should appeal to a very large class. The works of the Randall Hardened Stone Company are in Kentish Town Road, N.W.

Rindesland & Pattenden.

The Brülöo patent window reappears in an improved form, and as a thoroughly skilful invention it deserves the attention of visitors. The first advantage is that it can be cleaned on both sides whilst standing in the room, and therefore without the slightest danger to life or limb. It cannot be opened from the outside without breaking the glass. Broken panes can easily be replaced without getting outside. The windows never rattle in windy weather, and can be thrown open for ventilation 3 inches from the top and 3 from the bottom without the use of hammer, chisel or any other tool, or disturbing or shifting any of the beadings, which is a considerable advance upon anything of its kind. There can be no doubt that the Brülöo window combines all the advantages without the defects of some of its rivals. The mechanism in this case is perhaps more apparent, but then it attains many purposes, and is indeed a thoroughly careful and matured invention. The numerous accidents which might be avoided by the use of

the patent Brülöo window should induce visitors to give it an inspection. The patentees and manufacturers are Messrs. Rindesland & Pattenden, 461 Harrow Road, London, W.

Charles Davis.

Mr. Charles Davis exhibits at Stand No. 19 some of the high-class blinds and fittings for which the firm has a reputation extending over nearly a century. The point to be noted is that work of a common description has no place here, and high-class work is only undertaken. Mr. Charles Davis makes a specialty of his outside improved Spanish blinds, as well as of duchess lace-blinds of the newest designs and patterns, and the highest class venetians with the latest patent actions, cane and wire blinds, Japanese screens, &c. The firm's patent brass railway grooving laths and cornice poles are generally adopted by the trade, and specified by the leading architects. The only fault to be found with the exhibit is that it conveys but a slight idea of the large business of the firm. A comprehensive illustrated price list is now, however, being issued, and will be found to contain many of the new designs for this season. Architects, builders and the trade will find in them many useful ideas for exterior decoration. The works and offices are at 40 Castle Street East, Oxford Street, W.

W. Garstin & Sons.

Messrs. W. Garstin & Sons are again at the Exhibition, and, needless to say, it would be an invidious task to find the least fault with their exhibit; indeed, we consider it one of the most artistic that has ever been submitted to the public. The stand is divided into two distinct departments—the architectural and monumental—and the contrast is striking. On one side is seen the infinite variety of granites, marbles in the rough and manufactured state appealing to the architect, presenting a wonderful harmony of tints, and on the other side, the beautiful purity of white statuary monuments, &c., conveying that very tenderness and sympathy which they are designed to express. We think this arrangement of the exhibit adds to the effect, and enables the visitor more easily to comprehend the different branches of the business of Messrs. W. Garstin & Sons. The granite and marble departments are of themselves bewildering in their variety. Some of the granites shown are Scotch, Swedish, Norwegian, Labrador and Bavarian; and of coloured marbles, Italian, Belgian, Swiss, French and Irish, each has its special colour and requires particular treatment in the subsequent process of handicraft. It is held amongst the *cognoscenti* that freedom from blemish and perfect polish are indis-

pensable, and it should be obvious to anyone that unless a firm thoroughly understands the selection of the suitable rough material and how best to utilise it, it has no chance in competition with Messrs. W. Garstin & Sons; for in their case they do all this, and in some cases possess the quarries from which the granites come. Bavarian granite, for instance, arrives direct from the quarries in Bayreuth, Bavaria; Italian marble from the works in Massa Carrara; and quite recently an Aberdeen branch has been acquired for the Scotch granite trade, and the firm are members of the Aberdeen Granite Association. These facilities for carrying out every branch of the trade should commend themselves to those interested in high-class work. The infinite variety of selection is another point of which the exhibit will convince; but the works and showrooms at Kensal Green, W., are well worth a visit. The demand for architectural requirements is continually on the increase, and doubtless their value will soon be more generally recognised. Messrs. W. Garstin & Sons have recently fitted, under the direction of a firm of eminent architects, an hotel in Glasshouse Street, Piccadilly, W., with bars, pillars, &c. Granite-tipped tables are another specialty, which have a very pleasing effect. We hope the few particulars above will induce visitors to examine the exhibit in detail; or, failing a visit, to write to the works at Kensal Green, W., for new illustrated catalogue. The practical management of the large business devolves upon Mr. Aubrey Garstin, and the work comes directly under his supervision—a guarantee that it will be well done. The marble table tops and counter tops just introduced are particularly worthy of notice. The exhibit is highly creditable even to so enterprising a firm, in the variety of marbles and granites shown, not only in ornamental style, but in plain work. Messrs. Garstin & Sons are the sole consignees for Bavarian granites, besides being importers of Sicilian statuary and coloured marbles, foreign granites, &c. As already stated, Messrs. Garstin & Sons have an establishment in Aberdeen, The Polished Granite Works, in South Constitution Street. Besides the department that pertains directly to the requisites of architects and builders, the monumental department will be found full of interest for every visitor. Both Italian and English carved work is shown, and several beautiful specimens of workmanship are to be seen.

H. Cunnah, Wright & Co.

Messrs. H. Cunnah, Wright & Co., who show their patent fireproof construction system, are to be commended for the expedition with which their exhibit has been completed. The

CHARLES DAVIS,
40 CASTLE STREET EAST, OXFORD STREET, W.
Established nearly a Century.

firm actually erected a building exemplifying their own system in the course of a few hours, and thus proved the value of one of their claims to a saving of time by its adoption. We will just give a short description of this patent system of building fireproof floors and partition walls, the advantages of which are real and practical. The main principle may be said to consist of the application of patent corrugated iron sheets, laths and circular laths, which together produce a complete building. The sheets are not made in the usual undulated form, but are made so that each corrugation forms a separate dovetailed channel. It will at once be seen that, when corrugated in this manner, the sheets possess very great power of sustaining any weight laid upon them, at the same time forming a perfect key for plastic material of any nature. The illustration below will convey an idea of this. The system of building is simply this:—

The outside walls of the house are built varying in thickness according to the height of the building, &c. When the first floor is reached the joists are built in 3 feet apart and the iron sheets laid between with the ends of the corrugations resting on the bottom flange of the joists. A channel is left all round the wall about $1\frac{1}{2}$ inch to receive the ends or sides of the sheet and concrete, and so the whole is firmly keyed to the outer walls. For a 12-feet span 4 by 3 inch steel joists, placed 3 feet

apart, with the sheets laid between and filled up with concrete, form a floor 6 inches over all strong enough to bear a load of $1\frac{1}{2}$ cwt. per foot super, exclusive of its own weight. It will thus be seen that a saving is effected of one course of bricks 3 inches all round the building. Particularly is this economy of space effected by this system of partition walls, which gives a wall 2 inches thick when finished equal in strength and durability to a 9-inch brick wall. The saving of space is thus very considerable. These advantages are all illustrated in the exhibit, which is certainly a difficult test, and it is shown how columns, doorways, &c., are arranged. The London County Council have, we notice, adopted it, and we hope it will meet with the success it deserves.

C. Batchelar.

Mr. Charles Batchelar, of Holloway Road, N., has a large variety of barrows, ladders, &c., in use by contractors and builders. A specialty is made of a device called a "cripple," a substitute for scaffolding in small work, which is fixed on to the sides of the ladder. Mr. Batchelar is a very large maker of all these requisites, and claims to do only substantial, strong work at the lowest possible rates; and situated near Holloway Station, G.N.R., there is every facility for quickly despatching to all parts.

P. Bastendorff & Co.

Messrs. P. Bastendorff & Co., of 4 Euston Square, N.W., are well represented at Stand No. 91 by every description of bamboo furniture. This firm occupy the premier position in this specialty, and their exhibit does them justice. We intend in a subsequent issue, to notice an architectural feature of the firm's business, viz. bamboo bungalows.

Christopher Anker.

A detailed and illustrated description appeared in *The Architect* for July 8, 1892, of the works and marbles of Mr. Christopher Anker, of Fredrikshald, Norway. A representative collection of Norwegian marbles is on view at the Exhibition, of marble slabs in all varieties, and of marble work as worked for table-tops, mouldings, &c. The collection is evidently meant to be representative rather than a selection of choicest specimens picked out for peculiar excellence as exhibition gems. The variety is large, samples being shown of Brèche Rose Vif, Jaune Rose Royal, Brèche Petit Melanche, Blanc Veiné, Brèche Violacée, Bleu Tigre. Many of

these show curiously erratic colouring and markings that cannot fail to attract attention. Melanche Rubane, Citron, a beautiful and equally distributed colour throughout, Blanc Veiné, Vert Rose, Gloire Fauske (mainly red, with white and buff interlaced), Vert Canrobert, statuary distinguished by purity of white, antique Ruban, a grey and white. Very large polished marble slabs are also shown, black finely veined with white and white veined with black, and other choice variegated marbles.

Next week notices of other exhibits will appear, and among them of the exhibits of T. Freeman; E.C. Braby & Co.; Dove's Sanitary Company, Limited; Ellis, Partridge & Co.; Marsden Tile Company; Bedford, Lemere & Co., &c.

THE "PREMIER" HAND-POWER MORTICING MACHINE.

IN designing this machine, which is just being put in the market, the aim has been to produce a machine with few parts and complete as possible. The power applied to the machine handle is transmitted direct to the chisel, and has not to pass through a number of joints, pins and levers, as in most other designs; therefore by this construction more useful work can be done by the power applied than by any other. The machine is suitable for working either hard or soft wood, and is therefore useful for cabinet-makers, joiners, wheelwrights, and other workers in wood. The frame is all in one casting, thus giving the machine great rigidity and strength, both of which are not only desirable but absolutely necessary for the execution of good and accurate work. The handle for bringing down the chisel to its work is placed so that the operator stands in an easy and natural position whilst at work. The head may be raised or lowered to suit the various thicknesses of timber. Each machine is complete with boring apparatus, six self-coring chisels, one core driver, spanner, &c. The leading features claimed for the machine are its simplicity, strength, accessibility to all working parts, no joints or pins, large wearing surface, good finish and cheapness.

THE GRINNELL SPRINKLERS.

THE advantages of the Grinnell Sprinklers of Messrs. Dowson, Taylor & Co., Limited, engineers, 14 Queen Victoria Street, E.C., were shown at the fire which occurred last week at the flour mills of Messrs. Marriage, Neave & Co., Limited, Battersea, S.W. The flour mill proper is protected with a very

complete installation of Grinnell Sprinklers. The fire, however, did not in any way injure the mill, and the sprinklers were not, therefore, called into action. The grain warehouse was burned down, and the screen room was damaged slightly by water. Neither of these portions were equipped with sprinklers, but it is the opinion that if sprinklers had been in the warehouse it would be standing now. A fire-pump which Messrs. Dowson, Taylor & Co. put down for the firm, and which is used in connection with the fire hydrant service and the sprinkler installation, did very good service at the fire. It was working nearly all night, and it was from this engine that the first hose jet was brought to bear on the flames.

NATIONAL REGISTRATION OF PLUMBERS.

AT the last meeting of the Registration Committee of the Hull District Council for the National Registration of Plumbers it was resolved that the next examination of the students attending the local plumbing classes should be held at Hull on Tuesday and Wednesday, the 28th and 29th inst. It was also resolved that, subject to a sufficient number of candidates applying, an examination of applicants for registration should be held on April 8, and that the same should be advertised in the local press. It was remitted to the secretary to make the necessary arrangements for the exhibition of the work executed by the students in the plumbing classes.

LIST OF REGISTERED PLUMBERS.

London Journeymen.

GRISLEY, L., 5 Patriot Square, Cambridge Road, E.
SIMPSON, F. A., 92 Augustus Street, Regent's Park, N.W.

ALTAR CROSS, ST. GEOGRE'S CATHEDRAL, KINGSTON, ONTARIO.

THE Classic altar-cross in polished brass, of which we give an illustration, is about 4 feet 6 inches high, and has been treated to harmonise with the reredos designed by Mr. Frank Darling, architect, of Toronto, and executed by Messrs. Hart, Son,

Peard & Co. The centre plaque is an Agnus Dei in bas-relievo repoussé, with the evangelistic symbols at the four ends, conventionalised so as to be in harmony with the general motif, the panels containing these being deeply recessed and moulded. To avoid the monotony of plain square ends their outline has been broken up by the Etruscan scrollwork, similar to the celebrated bronze cross of Donatelli on the high-altar at Certosa di Pavia, and an emblematic circle surrounds the central panel relieved by honeysuckle detail. The base is a

Calvary, and the junction of the upper part with it is effected by transposed trusswork, the exposed faces of which are delicately moulded. Inscriptions on the base record its presentation to the cathedral in memory of its first Chancellor by his children. The cross will gain much by its position and surroundings when in place, standing in line with a series of columns supporting an entablature, and in an alcove just above the retable.

BUILDING REGULATIONS IN CHICAGO.

A REVISED building ordinance is now before the City Council of Chicago, Ill. The maximum height of buildings is fixed at 160 feet above the sidewalk level. It favours piles for foundations, but does not forbid the use of steel or iron rails. All buildings devoted to the sale, storage or manufacture of merchandise, and all stables which are 100 feet or more high, must be entirely of fireproof construction. Buildings of less than 100 feet and more than 60 feet high must be entirely of slow-burning or mill construction; buildings of less than 60 feet in height may be of ordinary construction. In Class 2, buildings used as residences for three or more families, hotels, boarding or lodging houses, &c, occupied by twenty-five or more persons, and all office buildings which are 90 feet or more high, must be entirely of fireproof construction. If less than 90 feet and more than 60 feet, their construction must be slow-burning or mill construction. If they are less than 60 feet in height their construction may be of the ordinary sort. Class 3, all buildings used as residences for one or two families, or for less than twenty-five persons, may be built of ordinary construction, except if they are 60 feet or more high, they must conform to the limitations fixed for buildings of Class 2. In Class 4, all buildings used as assembly halls for large gatherings, whether for purposes of worship, instruction, or entertainment, must be safely constructed under rigid rules. Height of buildings of non-fireproof construction is estimated from the sidewalk level to the highest point of the roof.

CONSTRUCTION OF MANUFACTURING BUILDINGS.

AT the meeting of the Gloucestershire Engineering Society, Mr. Robert Phillips, county surveyor, read a paper entitled "Notes on the Construction of Buildings for Manufacturing Purposes." He said, given a sufficiently extensive site, buildings on all the ground floors are best, but it often happened several floors were required. When surveying the plot one of the first things to settle was the level of the ground floor. If there is a public road near, level off the centre of the road, and keep the principal entrance so that you can easily get in at it, remembering that the road will gradually rise. Westgate Street is some 8 feet above the old Roman level. Drive a peg down, and take a reading with the dumpy level off some fixed point, then set out the leading lines, and twist the plan about till you can get a north light where you want your best lights. Before a trade building can be planned properly its special business must be studied. Well-designed engineering shops are begun with the foundry and boiler-shop, the erecting and finishing shops coming last. Ascertain if the business requires machines driven from below or by overhead belts, and see if drainage for the basement is possible. Subways should be high and well-lighted, or the bearings and shaftings will be neglected. Where part of the work is outdoor, requiring a yard, the L-shaped plan is the best, with the foreman's office in the angle, with windows looking into the yard and into each shop. If there is more than one floor there should be staircases inside the offices, giving access to each floor, and lifts at the angle of the L, or at the end of each arm. In all large works the prime cost is the most important, and this starts with the timekeeper, who should be the assistant or the prime-cost clerk, and their offices should adjoin. If the motive power is steam the boiler-house should be so placed that coals can be tipped direct on to the shovel-plates. Where the processes have to be kept secret and visitors are not allowed there must be a waiting-room at the entrance, and it is well for this to be near the general office and all workmen to pass through this under the eye of the clerks. There should be one entrance for every 150 men. With 500 men with metal tickets to check in and out at one entrance he found nearly an hour a day was lost, partly by the men and partly by the master. By making three entrances and changing the form of the metal ticket to a ring, and placing rods handy for the men to drop their tickets on as they walked through, the time was reduced to ten minutes. In most factories the shafting is run too slow. If the business requires the moving about of heavy weights fixed cranes or overhead travellers will be required, and it will be necessary to prepare for these in the foundations. Details were given by Mr. Phillips as to setting out buildings and laying in thoroughly good foundations, the importance of which he insisted upon to prevent future shrinking and sinking. Wherever the ground-floor is of brick, stone or tiles, the damp

course must be above the floor. Wherever it is of wood it must be below, and if on the ground-joists it must be below the plate and air-bricks be provided for ventilation. Sawn slate with tongued joints and stoneware are the best, and felt and tarred paper the worst. A pitch-and-tar damp course, fairly reliable, can be made of 1 pail of pitch, $2\frac{1}{2}$ of tar and 8 of sand, well boiled together. Details as to building the brickwork were given, and several valuable practical hints were also given. Firebricks as lining to furnaces should be laid in half brickwork. In regard to mortar, he said there should be good lime one part, and good sand or ashes three parts, with clean water mixed on a hard floor, and a little foundry sand will make it equal to some cements. He next described the best methods of constructing floors, noticing the different kinds in use. Coming to roofs, he showed how the different kinds were best made and the best materials to cover them with. He could say little for galvanised iron roofs, as he had found a large one cost more for repairs than the first cost of any other kind of roof. Details followed regarding doorways, windows, lighting and warming appliances. Mr. Phillips urged that steam was preferable to hot water for warming purposes.

EMPLOYERS AND WORKMEN.

At the last meeting of the Manchester Association of Engineers, Mr. T. Daniels, president of the Association, in the chair, there was a large attendance of members. A paper on "The Relations between Employers and Workmen in Engineering Works" was read. Mr. C. R. Iorns said the question of the conditions of labour—in other words, the relations between employers and workmen—had become so strained and acute that some forty years ago it crystallised itself into what was called the "Condition of England Question." Since then these relations had greatly improved, notwithstanding certain ugly facts, as, for instance, the prolonged dispute between the Lancashire cotton spinners and their workpeople, which, apart from all the loss and suffering the dispute entailed, was marked by an absence of bitterness and acrimony on both sides, and by a forbearance founded upon an enlightened intelligence, which had never been so conspicuous in a labour dispute before. This conflict and many others in recent years showed that the masters had come to regard their workpeople as something more than mere machines, and that the work-

people were disposed to act more like men and less like machines. A great improvement had therefore taken place between masters and men, and it was significant that to the satisfactory solution of the capital and labour problem the best thought of this and other countries had been given for many years past, and numerous experiments had been tried, some of them at great cost, with a view to hasten this solution. To enable the faculties of a man—mental and moral as well as physical—to attain their full development, it was now contended that shorter hours of labour were necessary. An interesting experiment of what was known as "The forty-eight hours' week" was being tried by a Manchester firm of engineers, Messrs. Mather & Platt. Whether all that was expected from this experiment would be realised was very doubtful; but, whatever the result might be, the experiment would be watched with the greatest interest by all large employers of labour, and should the expectations of those who had faith in it be approximately realised it would give an impetus to the demand for shorter hours that it would be difficult to resist. As things now stood many of the employed seemed to think that all they had to do was to get inside the gates of the works a certain number of times per week to entitle them to draw their wages at the week end, utterly ignoring the common-sense principle that the employer was entitled to their full services during working hours. All present must be aware of the general dilatoriness displayed by the men in getting to their benches or machines after the bell had been rung. As a rule fully five minutes were lost at each starting-time before the work was commenced, and this entailed a serious loss to the employer. Take the case of a firm employing 500 hands, with three starting-times a day. The total time per day would be 125 hours, making a loss equal to the rental of a works employing this number of hands. Another feature was the ingenious manner in which the men in all branches "nursed" their work when they supposed orders were scarce, and how, when orders were plentiful, they seized upon the most trivial points to harass the concern. It was a matter for regret that, owing to the want of thought arising from defective or little education, the workmen were now so easily led astray by the plausible phrases of the professional agitator. To insure industrial peace and prosperity it was essential that our workpeople should be educated to the fullest possible extent, and then they would more and more recognise how identical their interests were with those of their employer, and be more influenced by that spirit of equity and justice expressed in the motto, "A fair day's work for a fair

day's wages." The closer the relationship between employers and employed could be drawn and the more fully the interests of each could be made identical, the nearer we should be to a state of industrial peace and prosperity.

NOTES ON NOVELTIES.

Improvement in Drain-testing Plugs.—We have pleasure in noticing the ingenious invention for drain-testing lately protected by Messrs. Price, of 139 Albert Street, N.W. It consists of a number of rings, each so fitted to the other that it is capable of testing a 4, 5, 6, or 9-inch drain, the whole thing when together being so compact that it takes up only the same

space as one of the ordinary pattern; the weight again is about one-third of the usual patterns. We give the above small illustration, as we cannot but acknowledge the great advantage gained by surveyors, builders, &c., whose duty it is to carry these things for the purpose of testing drains. The price, we understand, is less than the ordinary patterns.

VARIETIES.

AN inscription of the Emperor Cæsar Marcus Aurelius Severus (Alexander), who reigned from A.D. 222 to A.D. 235, has been found at South Shields within the site of the Roman station during the excavations for the erection of a Board school.

TRADE NOTES.

THE new Workhouse Infirmary, Lichfield, which is nearing completion, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke-flues, supplied by Mr. E. H. Shorland, Manchester.

WE are informed by Mr. James Brown, brick merchant, that he has removed his office from 103 Cannon Street, E.C., to his dépôt, Essex Wharf, Durward Street (opposite London Hospital), Whitechapel, E.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

4259. Thomas Potter, for "Improvements in the construction of fire-resisting floors."

4266. James Arthur Allen, for "A circular spring padlock."

4300. Walter Bennett, for "Improved means for preventing smoky chimneys."

4401. Francis Fitzadelm Persse, for "A new or improved draught preventer for doors, windows and the like."

4404. George Downing, jun., and Thomas Ryan, for "An improved firegrate."

4413. John Henry Davis and Richard John Kinkead, for "Improvements in draught excluders."

4440. Edward Drew, for "Improvements in or applicable to windows, fanlights and ventilators, for opening and closing, adjusting and fastening the same."

4459. Goy Peachy, for "New or improved dust-flue for domestic fireplace."

4489. Emil Carl Christian Krogh, for "Improvements in and relating to electric fire alarms."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

VARIETIES.

SEALED offers for supplying 3,000 barrels of Portland cement for the requirements of the harbour railway at Helsingfors can be sent previous to April 5 to the office of the harbour railway, Helsingfors, where tenders for the contract will be accepted, and where all details will be found.

MESSRS. CHEAL & SONS, of Crawley, Sussex, have won the first premium of 20% offered by the Leeds Corporation for plans for the laying-out of the grounds adjoining Kirkstall Abbey.

WE have received a letter from a competitor who asks permission to call attention to the result of the Hackney Baths

competition. As the writer has not sent us his name, his views as to the result of the competition cannot be published.

TRADE NOTES.

MESSRS. FOSTER & DICKSEE are getting the scaffolding into position for the purpose of building the superstructure of the new Public Record Office, Chancery Lane, E.C. The fireproof floors throughout are to be on the Fawcett system, the same as those now being put up in the new Admiralty buildings.

As an evidence of "taking time by the forelock," we are informed that the proprietor of the Prince's Theatre, Bradford, has ordered from Mr. C. Carr, of Grove Lane, Smethwick, a maiden peal of bells for use in the pantomime of "Dick Whittington," to be produced next Christmas.

MR. GEORGE WRAGGÉ, Wardry Works, Chapel Street, Salford, has just received instructions to supply the whole of the art metal-work for the new staircases, balconies, &c., to be fixed at the Manchester Royal Exchange, and also for the main staircase, balustrades, gates, &c., for the Manchester new Corn Exchange. Mr. Wragge has removed his London office and show-rooms from Surrey Street to 9 Southampton Row, Holborn.

MESSRS. BAIRD, THOMPSON & CO.'s patent inlets are being used for the ventilation of the new asylum at Mullingar.

THE tender of Messrs. Williams & Williams, of Mountain Ash and Cardiff, being the lowest, has been accepted for building mission chapel, Adamsdown Square, Cardiff, for parish of All Saints.

A FINE new turret quarter-chime clock has been presented to the new Town Hall at Richmond, Surrey, and a set of bells, by Charles Burt, the Mayor, Hillside House, Richmond, Surrey. The dials are lighted by electricity, and the clock has got all the latest improvements inserted from Lord Grimthorpe's plans. The work has been executed by Messrs. William Potts & Sons, Guildford Street and Cookridge Street, Leeds, from instructions received by them from Mr. Ancell, architect, London. Messrs. Potts also recently fixed a new clock at St. Luke's Church, Kingston, Surrey.

WE are requested to state that the business which has for many years past been carried on by Messrs. Robert Steele & Co., iron and brassfounders, of Sleaford Iron Foundry, Sleaford, is now carried on by Messrs. Robert Steele & Co., of Sleaford.

VOLUME XLVIII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

ford Street, Nine Elms, S.W., has been purchased by Mr. Joseph Stone, engineer, smith, &c. For the purposes of the new business Mr. Joseph Stone has taken into partnership his nephew, Mr. Chas. Grace, who has been associated with him for many years at the St. George's Road works, and who will in future take charge of the Nine Elms business. The style of the firm will be J. Stone & Nephew, iron and brassfounders.

BUILDING AND BUILDERS.

ADDITIONS are being carried out at the Sydenham branch of the London and South-Western Bank from the designs of Messrs. Folley & Son.

THE Bishop of Liverpool has issued an address to the churchmen of that diocese, urging them to raise a fund of not less than 10,000l. "for the purpose of making all existing church schools in the diocese in which defects have been pointed out thoroughly satisfactory as to their buildings and arrangements, and beyond the reach of condemnation."

THE Fishmongers' Company have in progress industrial dwellings on their Walworth estate, from the designs of Messrs. Chatfield Clarke & Son.

THE BUILDING EXHIBITION.

E. C. Braby & Co.

MESSRS. E. C. BRABY & Co., of Bangor Wharf, Belvedere Road, Lambeth, and Hope Wharf, Hill Street, Peckham, S.E., have an extensive display of various goods in which they are merchants and exporters; among these are to be seen tile dados for walls, rich in colouring and of real artistic merit. Good specimens are displayed of hearths, hand-painted and enamelled tiles in art tints.

Marble paving, which is extensively fixed by this firm, is also shown, and a goodly variety of tessellated and encaustic tile paving. An important show is made of marble and enamelled slab mantelpieces and marble fender curbs, also some handsome stoves.

Large slabs of coloured marble are exhibited with the faces only polished. A collection of samples of English and foreign marbles are at the stand, and can be seen if desired.

The sanitary department of their business is represented by marble lavatories and earthenware pedestal closets, comprising some of the newest designs in washdowns; whilst in the building material department some good specimens of slating and roof-tiling are exhibited, and also samples of a large variety of slates and tiles for roof purposes. This department is receiving special attention at present (the sanitary department is under the management of Mr. F. Kelly), and a new appliance is shown in the way of pedestal washdown closet, "The Trent," shown for the first time, with a patent indiarubber cone that anyone can fix and which also is a novelty.

Joseph Kaye & Sons, Limited.

The model of an emergency exit is shown at the stand of Messrs. Joseph Kaye & Sons, Limited, of 93 High Holborn, the idea of which originated from an architect. The model shows a door, in the centre of which is a panel of glass or other material that is readily broken. In case of an alarm of fire or panic the panel should at once be broken, and then access is obtained to a handle. The handle is pressed down when the door flies open and sets an electric bell going, so that managers, proprietors, &c., at once know that such a door is open as a means of ready escape. The idea of a door as an emergency exit is that it is only required for use in emergencies, and it is therefore kept locked, and cannot be opened without the key except by breaking the glass, when the "open sesame" is afforded, and lock and bolt yield as though they did not exist. This is already in use at London Board schools, and has, we understand, given great satisfaction. We might at the same time call attention to other excellent patent exit door fittings shown by this firm.

Electrical Wonder Company, Limited.

The public are familiar with automatic machines furnished with a slot for the reception of pennies, which are thereby set in action. A series of electrical machines with automatic action show Ahnschütz's instantaneous photographic picture objects in motion. The exactness by which natural motions are reproduced is marvellous, being lifelike. One shows a lady riding on horseback, movements of horse and rider given exact to nature; next a boxing match between two athletes is seen, a march past of soldiers, ladies dancing, performing dogs, parade of lancers, &c. The stand is under the management of Messrs. Lichtwitz & Bros., the head offices

REVOLUTION IN BUILDING.

ARCHITECTS are invited to Inspect the Exhibit of Patent System of FIREPROOF FLOORS, PARTITIONS and CEMENT BUILDINGS in General, &c.

CONCOURS NATIONAL, PARIS.
 SOUTH AFRICAN EXHIBITION, KIMBERLEY
 NOVEMBER 1892.

being at 425 Strand; also offices at 232 Edgware Road and 91 Brompton Road.

Bedford Lemere & Co.

Messrs. Bedford Lemere & Co. exhibit a choice collection of architectural photographs. In addition to buildings there is a large number of photographs of interiors, with also elaborate woodwork, marble-work designed by architects and carried out; for instance, one shows a beautiful entrance-hall, with noble staircase, &c. One magnificent photograph is the large one of Windsor Castle and its surroundings, which makes a perfect picture. It is seldom the chance is afforded of seeing a representative collection of the works of our architects grouped thus together. Curiosity as well as architectural interest can be gratified from the fine pictures of the many mansions and seats owned by royalty, nobility and distinguished commoners. It may interest many to mention that there are several of the late George Devey's works in the collection. No one visiting the exhibition is likely to pass this stand without lingering rather longer than they intended to inspect the works.

Société des Carrières des Marbres Antique de Saillon.

Researches made during the last twenty years proved that the famous old Cipollino marble was quite exhausted in the ancient quarries that alone furnished it. The old Roman and Carthaginian quarries had been apparently thoroughly worked, and no new beds could be found in the neighbourhood. The above-named company have been most fortunate in bringing the marble again into the market. The quarries discovered a few years since are, however, not in Africa, but on the north of the Mediterranean Sea, in Switzerland, at Saillon, Rhône Valley. It cannot be said for certain that the old Romans were ignorant of the existence of the marble at Saillon, but what is certain is that it is the genuine grand antique Cipollino. The highly-polished specimens shown at the exhibition speak for themselves. A magnificent column, 15 feet in height, that is shown is one of twenty destined for the Pump Room at Clifton, in the West of England, which are the gift of Mr. George Newnes, M.P. The marble-work for this building is being well carried out by Messrs. Arthur Lee & Bros., of Bristol. The following extract is deservedly shown at the stand, being the opinion of so great an authority, viz.:—"When this marble is worked up in columns and polished it resembles woodwork," says Mr. Jaccard, professor of geology, at Locle, in a remarkable study on the Saillon quarries. "One can notice the network, the ligneous fibres,

interrupted at intervals by natural nodosities. In slabs it also resembles ivory. This ribboned structure renders the antique Cipollino more suitable for the monumental decoration of churches, museums, &c. Those who have seen the colonnade of the church of St. Mark, in Venice, will never forget its beautiful effect."

Pickerings, Limited.

Messrs. Pickerings, Limited, engineers and ironfounders, Stockton-on-Tees, exhibit patent automatic self-sustaining lifts. These lifts are well-known and extensively used for service for dinner lifts and for invalid lifts. Sant's patent self-sustainer is a simple contrivance, both for single and double-lift gear, being a box with circular wedge falls. The load-rope wedges itself, and is only released for motion while the hand rope is grasped. It can be applied to any hand or power lifts of any capacity, and to belt power as well. We understand that it is now exhibited for the first time. It should also form a particularly useful adjunct for dinner lifts, and will commend itself to architects. A variety of lifts and hoists is, of course, on view, and among them attention may be drawn to a builder's hoist, self-sustaining, with automatic brake, the whole being simple and uncomplicated, also a self-sustaining quick-action chain sack hoist. Also various other appliances connected with lifting and hoisting purposes.

London Warming and Ventilating Company, Limited.

This company (121A Regent Street, W.) shows stoves and grates for burning anthracite coal. One is shown in action burning anthracite coal. The entire absence of smoke and the amount of heat thrown out can fail to be remarked. By means also of a brickwork chamber, connected, a flow of warmed air can be introduced into the room from the outside. An assortment of other grates, which are also suitable for anthracite coal are shown, various heating stoves, ranges, kitcheners. As regards economy of consumption, the proportion is considered to be that about two tons of anthracite are only consumed, where, with ordinary coal, the consumption would be about 3 tons, and that there is about 30 per cent. increase in the heat thrown out over that of ordinary coal.

Patent Wire-Wove Waterproof Roofing Company, Limited.

This company (108 Queen Victoria Street, E.C.) show a portable wooden room 14 feet by 10 feet, in sections, roofed with wire-wove waterproof roofing sheets lined with Indian matting,

and standing upon Allport's patent iron foundation shoes of smallest size, and fitted with Major Bale's patent automatic weatherproof louvres. The sheets are formed of papier mâché on a foundation of steel wire gauze japanned or tinned. It is claimed for them that they are damp-proof, sun-proof, cold-proof, tough, flexible, unflammable, enormously strong, light, and almost imperishable. They never warp or buckle. They are 60 per cent. lighter than twenty-four gauge galvanised iron, cost very little for carriage, and require a very slight framework. They make a practically air-tight roof, without any lining. There is no condensation of moisture inside, which is so objectionable and destructive in the case of iron roofs, and for all purposes of portable buildings, including bungalows, &c., the material is excellent. It is also intended to be applied as artists' boards, dados, friezes, panelled partitions, &c., and a special paint can be had as a cheap and effective protection against damp.

T. Freeman.

Mr. T. Freeman, of 200 and 202 Phoenix Street, St. Pancras, and Victoria Street, Westminster, whose exhibits have for the last year or two been an interesting item in the exhibition, has an extensive and well laid out stand in the central part of the main avenue. His display of glazed bricks, white and many tinted, in the form of two or three dwarf walls, is very effective; but he excels in a display of imperishable floor tiling and well-devised faience, forming dados for wall purposes. The tints in this last specialty are remarkable by the absence of undue brilliancy of colour, all shades being toned down and in harmony.

Ellis, Partridge & Co.

Mr. Freeman, who manages the whole of the London and suburban business of the well-known firm of Ellis, Partridge & Co., of Leicester, was deputed by them to exhibit a splendid display of their moulded bricks, known as the "Redbank" brand. Though we had occasion last year to call special attention of our readers to the products from their brickworks at Measham, it is gratifying to us to applaud the distinct advance made in the character of the moulded and other special bricks and terracotta specimens exhibited on this occasion. We have rarely, if ever, seen more perfectly-formed panels, angles, stops, &c.; in fact there is an originality and excellence of design not often met with. Three sections of walls were shown, two of which indicated the character of the Redbank clay when used for

square facing bricks; but as these goods are now so generally adopted by leading architects for facing purposes, we need not further comment on their rich colour and admirable texture and finish. The other section of the wall indicated the effect of Messrs. Ellis, Partridge & Co's sandstocks, "Woodville" brand, a class of bricks most appropriate for mansion and church work.

P. & S. Wood.

Messrs. P. & S. Wood, of South Staffordshire, exhibit this year some fine specimens of stable-paving goods, their panelled brick channel work being much admired. This firm, with a reputation of sixty years, is perhaps more successful than any other house in producing bricks whose vitrified surface and perfectly calcined clay secure an immunity from the ravages of time and the decomposing effects of atmospheric changes.

The control of Messrs. P. & S. Wood's business in London and the home counties is in the hands of Mr. T. Freeman, of St. Pancras and Westminster, and we learn from him that during the past twelve months their Pump House works at West Bromwich have been taxed to the utmost to keep pace with the railway, engineering and building contracts entrusted to their care.

Dove's Sanitary Company, Limited.

We cannot too strongly advise inspection of what the above-named company with some reason style "The Perfect Disinfecting Apparatus," which has deservedly been patented by Mr. L. Dove. The apparatus, however, only costs about 2s., but as many of the public besides architects and builders have practical acquaintance with disinfecting chemicals and apparatus, they will be able to appreciate the efficiency of this appliance without difficulty. The apparatus is shown in action at the hall. It is a handy little article which is charged with disinfecting fluid and merely requires to be placed in the flushing cistern, when, at every discharge, its sanitary results follow. The article is merely a small copper vessel, which when charged and placed in position is at once ready for immediate use, and without recharging can be kept at use for months. At the office of Dove's Sanitary Company, Limited, 66 Finsbury Pavement, E.C., where it is in constant use to show customers, the calls are more numerous than would be the case for use in public or private buildings, and we understand that even in this case it will go for five months without recharging. We recommend sanitarians to inspect the apparatus.

CROSSLEY BROS., LIM., OPENSHAW, MANCHESTER.

The Largest Manufacturers of Gas Engines in the World.

F. Willis & Astley.

A fireproof and ventilating floor is shown by Messrs. F. Willis & Astley, of 34 Ely Place, Holborn Circus. It is patented in England, France, Germany, Belgium and the United States of America. This flooring is constructed with lintels made of the finest fireclay or terra-cotta, and designed in such a manner that the lintels completely encase and protect the bottom flanges of the steel joists upon which they rest, and at the same time are so constructed as to form a perfect ventilating chamber through the floor. The spandrels are filled with concrete carried on thin sheet-iron placed over the lintels, and form a series of arches springing from joist to joist, thus combining great strength with lightness. The flanges of the lintels are so formed as to allow of a circular opening 7 inches in diameter to be cut, and forms direct communication with the air chamber connected with flues constructed in the brickwork, or with gratings built in the walls. Messrs. Frank Willis & Robert Astley are the patentees. A notable feature of the patent floor of course consists in special ventilating properties.

The Safe and Portable Scaffold Company, Limited.

The Safe and Portable Scaffold Company, Limited (Mr. Albert J. Shingleton, managing director), of 110 Kensington High Street, W., show their ingenious apparatus which has been constructed in accordance with its name as a safe and portable scaffold. Its range in height, from 20 to 70 feet, is more than sufficient to meet all usual requirements, though the height of 70 feet could, it appears, be practically exceeded. The desideratum in scaffolding apparatus for working on existing buildings is the securing of safety for the workmen who use it and for the public who walk the pavements of our streets, and these conditions seem amply obtained.

W. R. Hough.

Hough's (135 Great Suffolk Street, Southwark, S.E.) patent reversible sash frame with sliding sashes is shown in the exhibition. The great feature of this patent is that where it is used the danger of ordinary window-cleaning is got rid of. The window has not to be cleaned, as in ordinary windows, from the outside, but the whole window, both the outside and the inside, can be cleaned from inside the room. The advantages of such a sash cannot be too widely recognised, as periodically lives continue to be lost where the old-fashioned sashes are adhered to. Existing windows, it appears, can in a

few hours and at small cost be adapted to Mr. Hough's principle. The whole arrangement also appears simple and free from any complication.

J. M. Boekbinder.

Some specialties of Mr. J. M. Boekbinder, 14A Elm Street, Gray's Inn Road, are shown at the stand of Mr. T. Freeman. Many are already acquainted with the excellent "hand-painted Gobelin tapestries" executed by Mr. Boekbinder. Two of these hand-painted decorations are shown, one after *Les Buveurs*, of Teniers, the other being "A Mad Freak," showing a lad and a lass, the one holding a cat and the other attaching a frying-pan to its tail. Decorations in modelled plaster-work are also shown. Any designs for decorations of walls, ceilings and other interior enrichments can be carried out. As to the excellence of the work, it is only necessary to look at the list of names of architects under whom work has been done, a list which includes the names of nearly all the well-known architects.

Baillie & Lutwyche.

In the notice in last week's issue of *The Architect* of the fine exhibit made by this firm occurred the following:—"A bunch of orchids is remarkably effective, both as regards modelling and shaking." Our readers will have already seen for themselves that "shaking" was a misprint for "shading."

NATIONAL SPORTSMAN'S EXHIBITION.

THE prospectus of the National Sportsman's Exhibition, which is this year to be held at the Royal Aquarium, Westminster, from April 24 to May 6, containing all necessary information for intending exhibitors, has been issued. It is stated that the exhibitions already held in this centrally situated and popular place of amusement have been in the highest degree successful, and the results to exhibitors have been of the most satisfactory character. The attractive entertainment and continual round of amusements given at the Royal Aquarium secure for it at all times a large attendance, and insure its being included in the programme of all visitors to the metropolis. The Royal Aquarium is easy of access, omnibuses and trains from the City and West End continually passing the doors, thus rendering it one of the most desirable sites in London for exhibition pur-

poses. The National Sportsman's Exhibition will be under the management of Mr. F. A. Cavendish Macdonnell, who has been associated with similar exhibitions for several years, and everything possible will be done to make it thoroughly representative in character and to insure its complete success. The offices of the exhibition are at 341 Strand, W.C., and the space being limited, early application is requested.

WELSH SLATES IN IRELAND.

AT the ordinary half-yearly meeting of the shareholders of the Killaloe Slate Company, Limited, held at Jury's Hotel, Mr. Samuel H. Bolton, builder, presided. The Chairman said the pleasure of meeting the shareholders on this occasion was lessened by the fact that they had no dividend to pay. The reason was want of customers for their slates. When iron was cheap farmers used it for roofing instead of slates. The directors were always on the alert to endeavour to secure an order when they heard of a building being erected. They did the best they could, and endeavoured to keep down the expenses.

Mr. Sharpe said he saw references made in Parliament to the effect that Killaloe slates were not as good as the Welsh slates. That statement had been contradicted, but it had been made again in Parliament in answer to a question; and further said that they were not as cheap as the Welsh slates.

The Chairman said the statement had since been modified. As the question of Government contracts was now under discussion he hoped this matter would not be gone into publicly now.

Mr. C. W. Beggs remarked that if their slates were equal to the Welsh slates, the fact should be made public. The Board of Works and other public bodies should not be left under the impression that the Killaloe slates were inferior to the Welsh.

The Chairman replied that the Board of Works were not under any such impression, for they were using the company's slates. A complaint had been made that the Irish slates were exceedingly thin, and so they were being made to suit the Board of Works.

Mr. Beggs: Is your statement to go forth that the Killaloe slates are not as good as the Welsh?

The Chairman: Our slates are as durable, and we have the proof of half a century for that.

Mr. Walker: In your opinion as a practical man are the Killaloe slates as good as the Welsh?

The Chairman: I say they are as durable.

Mr. Beggs: I don't think that is a fair question to put to the Chairman.

In reply to Mr. Walker, the Chairman said that in certain localities the Killaloe slates were the cheaper. The Bangor slates were the better, but what the Killaloe Company had to contend against was, that inferior Welsh slates were sold as Bangor slates at low prices, and it was difficult to compete against that.

In reply to Mr. Sharpé, the Chairman said the company had at present two contracts with the Board of Works for roofing post-offices. Their slates were being used by the principal public departments.

Mr. Macnie said their slates had been used to roof the Four Courts in Dublin. The Ecclesiastical Commissioners had always used them, and had it not been for the disestablishment of the Irish Church they would use them yet; but very few churches were now being built. The quality of the slates must be good, for they had lasted on the roofs of the churches and on the Four Courts.

The Chairman said another thing the company had to contend against was that specifications were almost always on a stereotyped form, and when architects specified a foreign slate the specification had to be adhered to.

THE BATH STONE FIRMS, LIMITED.

THE fifth annual general meeting of the Bath Stone Firms was held on the 17th inst. Mr. C. J. Pictor presided.

The Chairman said he was glad to be able to present a report which he felt sure they would heartily and unanimously adopt. The total profits for the year amounted to 15,000*l.*, out of which an interim dividend was paid in September last, absorbing 7,043*l.*, and leaving 7,949*l.* now available for distribution. It was now proposed to pay a dividend of 7 per cent., which would leave a balance of 61*l.* 10*s.* to be carried forward. This would make a total dividend for the year of 16*l.* 12*s.* 6*d.*, being an advance of $\frac{1}{4}$ th per cent. To some this might appear an insignificant increase, but to properly appreciate it they must imagine what their feelings would have been had it been so much less. It was a source of gratification to know that,

notwithstanding the long winter of 1891-92, affecting as it did the trade in the early months of the year, and the strikes in various branches of the building trade by which means the consumption was very much reduced, notwithstanding these drawbacks they had increased their sales for the year. Referring to other portions of the balance sheet he pointed out that the account showed debts due to the company, after making the usual reserves, amounting to 17,215*l.*, as against 5,397*l.* 4*s.* 7*d.* owed by the company, leaving a balance to their credit of 11,818*l.* The cash balance at their bankers and in hand was 10,378*l.* He was sure they would think this a very excessive sum, but efforts had been made, so far without much success, to find suitable investments, and the directors would be glad if the shareholders could introduce some good mortgages. In addition to cash in hand they held bills receivable to 2,580*l.*, and capital invested 11,817*l.*, 3,018*l.* of which had been invested during the year. 16,865*l.* was the total sum now written off for depreciation; there had been no special expenditure during the year, and none except what had been paid out of the current year's revenue. In conclusion he said he was sure they could not be other than satisfied with the past year's work, and moved the adoption of the report and accounts.

Mr. Sumsion seconded the motion, which was carried *nem. con.*

On the proposition of the Chairman, seconded by Mr. J. Stone, it was unanimously agreed that a dividend at the rate of 7 per cent. per annum should be declared for the half-year ending December 31.

The retiring directors, Messrs. I. Sumsion and R. Cripps, were unanimously re-elected on the motion of Mr. J. Pyke, seconded by Mr. Wilson, and appropriately thanked the shareholders for the honour thus conferred upon them.

Mr. Randall proposed that the remuneration of directors, other than the manager and secretary, for the year 1893 be at the rate of 100*l.* for every 1 per cent. dividend actually paid to the shareholders, and so in proportion with every fraction of 1 per cent.

Mr. Chirnside seconded, and spoke of the care, ability and conscientiousness with which the directors discharged their duties, especially alluding to the practical experience of the Chairman. Carried.

Mr. H. Pictor proposed that Messrs. Cooper Bros. & Co., chartered accountants, London, be re-elected as auditors at a remuneration of 70 guineas per half-year, including expenses.

Mr. Giles seconded, and the proposition was adopted.

Mr. Hancock stated that the Fluete was making satisfactory progress and was being used on Portland and other stones as well as Bath stone. Mr. Brydon had specified it for use on the new Municipal Buildings in Bath. As to the railway rates, they had been given much trouble, but he was not without hope that the directors had succeeded fully in their negotiations with the railway authorities, though he could not say absolutely then. The directors looked upon the question, however, with considerable satisfaction.

A vote of thanks to Mr. Pictor for presiding, and Mr. Hancock for his remarks, brought the meeting to an end.

TRADE UNIONS IN THE UNITED STATES.

THE report of the Royal Commission on Labour dealing with the United States gives some details of the working of the trade unions there. The New York unions are especially strong, but, on the other hand, the presence of a large foreign element, constantly recruited by immigration, constitutes a peculiar difficulty. The unions aim at converting all establishments in which their members work into "union shops," where none but unionists are employed; but there are individuals and agencies in New York who make a business of organising gangs of men to take the place of unionists on strike. Sometimes these individuals contract to furnish employers with cheaper labour on condition of themselves receiving the post of foremen. They draw their supplies from the country towns and villages as well as from abroad, and it is stated that employers who wish to replace unionists by the cheap labour give notice of a reduction in wages and bring on a strike. If, however, the establishment is then converted into a "mixed shop," the representatives of the union try to get employment in it, and by mixing amongst the newly-imported labour and exercising their influence to bring matters back to their old condition. The most effective instruments in the hands of the unions are the "shop committees" and the "walking delegates." The former is a small body of workmen entrusted with the care of the union interests and empowered to watch for the due observance of the union rules. They call meetings of the employes, and have been known to do so during working hours, though this is not usual. The employers frequently complain of their action, and still more of that of the "walking delegates," or inspectors appointed by the unions in industries such as building or house-painting, which are carried on in many different places. A number of

cases are reported in which men at work on buildings were ordered by a walking delegate to lay down their tools and quit work because of some infringement of union rules or the presence amongst them of a non-unionist. During 1890 strikes ordered by these inspectors are said to have occurred in the building industry upon every working-day. According to the Illinois Bureau of Labour Statistics the American trade unions owe their existence to the growth of the factory system and the consequent estrangement of the employer from the workman. They first came into prominence at the beginning of the present century, in a period characterised by the same abuses in respect of long hours, low wages, insanitary conditions and excessive labour exacted from women and children as are recorded in England prior to the passing of the Factory Acts. But in the opinion of several writers of authority the history of trade unions has been less satisfactory in America than in England, owing to the democratic character of the people, the mobility of labour and the independence of the American mechanic. They are still seeking many things already gained in England, such as the abolition of the truck system and the complete legal recognition of the unions. The Pennsylvania Bureau of Industrial Statistics reports that American trade unions issue fewer publications than those in Great Britain, and attributes this to the comparative indifference of members. Branch unions sometimes repudiate the ordinary dues when called upon to pay them, preferring to be cut off from the main body; but in times of difficulty they have been known to return and pay up arrears. All the unions amongst employés are in principle in favour of arbitration as a means of preventing strikes, but the strike expenditure is still very considerable, and arbitration is less successful in America than in England, because the American trade unions are much weaker and less highly organised.

THE SANDGATE LANDSLIP.

THE following report has been made by Mr. Walton, engineer of the Local Government Board, who was deputed to examine the area of the landslip and report as to its probable cause:—

The first of the indications of the landslip occurred on the afternoon of Saturday, March 4, at about 5 P.M., and a further movement took place on the following day. The disturbed area is included within the boundaries of a roughly-shaped segment as shown on the accompanying plan, the chord of which measures about 2,800 feet. The arc of the segment intrudes

into high land; and the chord line follows an irregular course along the foreshore, between high and low-water mark. Along this line there are visible signs of a slight upheaval, a layer of blue clay being obtruded through the line of structure. Fresh water was in some places running from the fracture at the time of my inspection. The whole of the disturbance north of the main road appears to consist of a *débris* of a former landslip which probably occurred many years ago, perhaps centuries. The strata consisted of fine loam sand, green sand and layers of clay. The maximum depth of subsidence is about 10 feet. The chief features and cracks are generally in a direct parallel to the curve of the segment. The movement appears to me to have been confined to subsidence, as I find no proof of a general lateral action. In some places the land has slipped, but in such cases the lateral motion has, I think, been due to the previous steep inclination of the surface. Seventy-four houses have been injured, more or less, some beyond repair, and ninety-four houses in all have been vacated. The new sewerage works, being outside the disturbed area, have not been injured in any way by the landslip, but an 18-inch sewer-pipe laid from the camp at Shorncliffe has been broken in several places, and its massive masonry outfall conduit has been raised and fractured by the upheaval of the foreshore. The old sea-wall has been cracked through in places, but the new sea-wall is uninjured. The water and gas pipes have been fractured, and are now under process of repair. The sewer from the camp is also under repair. The pavements and kerb-stones which have been displaced are being rapidly relaid. Two sea-groynes have been injured, and the coastguard station has suffered considerably. As a possible cause of the disaster, it was stated that for some period concluding last year operations had been carried on for the removal of the steamship *Benvenue*, which had stranded at a point about 600 yards seaward of the front of Wellington Terrace. It was said that the shocks from the explosion were perceptible on shore. Most of the houses have little or no foundations. The rainfall for the month of February was said to be abnormally copious, and that as much as 2.31 inches is recorded as having fallen in one week of that month. No observations have been taken at any time as to the height of the subsoil water. It would appear from the evidence of several gentlemen that for some time past a variation in the disposition of subsoil in water has been noticed, and as instances in support of this, it was stated that the foreshore in front of Wellington Terrace was formerly liable to a general weep of fresh water, which for some months past has discon-

tinued. Also that a walk in a private garden, which had been previously subject to springs, had recently become dry. Then, I understood a slip occurred in land situated at or near the level of the main road. Another instance is a large lawn situated in high land, which defied all attempts to keep it free from springs until about a year ago, when it suddenly became dry and firm. A well situated a little above the level of the main road was pointed out to me as one in which the water would not rise, but in which for the past few months the water had accumulated to a high level. My inquiry was conducted under great disadvantages, as there were no recorded observations of the levels of the subsoil waters, no sections of the cliff or of the foreshore, and no geological plan. Taking into consideration the limited time at my disposal, and the entire absence of any reliable data, it is quite impossible to form anything but conjectural conclusions as to the cause of the disaster. From what I saw, and from the evidence, it seems to me probable that the cause was due to the sudden release of impounded subsoil water. I was also told that from time to time subsidences of minor parts had occurred, and I noticed that many houses had evidence of repaired and patched-up cracks upon them. There appears to be some difference of opinion as to the foreshore. It was asserted that since the completion of the groynes the aggregation of shingle on the shore had been most marked, whereas it was also said that the angle of the foreshore had increased very much recently, due, it was alleged, to the process of erosion caused by the action of the sea. I noticed small streams of water in many places running into the fissures and cracks, also surface depressions upon which water would lodge. These conditions, I think, are favourable to further subsidence, and I am strongly of opinion that the earliest steps should be taken to prevent the accumulation of water on the high ground by the construction of surface gullies or drains, by which it can be taken by the most expeditious route to the sea. I expressed my opinion to the local board (as to the probable cause of the disaster) in terms as stated above, and I recommended them to procure the services of an experienced engineer to advise them as to the steps to be taken in the general interest of the ratepayers; and, as a temporary measure, I suggested the propriety of inducing those interested in the safety of the place to make early arrangements for the passage of the subsoil water from the high land. I also expressed an opinion that probably the introduction of a proper system of surface and subsoil drainage would prevent further disaster.

THE ARBITRATION COUNCIL BILL.

THE text of the bill to establish Councils of Arbitration in trade disputes has been published. The bill is backed by Mr. Cayzer, Sir F. Dickson-Hartland, Baron Henry de Worms, Sir George Baden Powell and others. The principal clauses are as follows:—

2. This Act shall not apply to Ireland.

3. In this Act—

The expression "district" shall mean the area under the authority of a County Council.

The expression "County Council" shall, in the application of this Act to England, include the council of a county borough.

The expression "employer" shall mean any person or body of persons, corporate or incorporate, employing not less than twelve workmen in the same business, or department of the business, in which the trade dispute has arisen.

The expression "workman" shall mean any person in the employment of an employer as defined by this Act.

A "trade dispute" shall be deemed to have arisen whenever a difference exists between an employer and his workmen which may seriously affect the employer or the workmen, or when a strike or lock-out is threatened or has actually taken place.

The expression "board" shall mean a board of conciliation and arbitration as established under this Act for each particular district.

4. (1) A board of conciliation and arbitration shall on or before January 1, 1894, be established in every district.

(2) The board shall consist of five members, to be appointed by the County Council in each district, of whom two shall be employers or members of some association representing employers, and two shall be workmen or members of some trades union, and one shall be neither an employer nor workman, nor a member of any association representing employers or any trades union.

(3) The first appointment by the County Council shall be made on or before January 1, 1894, and the members so appointed shall hold office for two years subject to reappointment.

At the expiration of two years from January 1, 1894, and of every subsequent period of two years, the County Council shall again appoint five persons to be members of the board in place of the retiring members, and such persons shall, subject to reappointment, hold office for two years.

(4) In case of the bankruptcy or lunacy of a member of the board he shall forthwith vacate his office of member.

(5) The County Council shall upon the death, bankruptcy, lunacy or retirement of a member of the board, appoint some other person to act in his place for the remainder of the term for which he was appointed.

5. When a trade dispute has arisen in any district between an employer and his workmen the board of that district shall, upon application as hereinafter provided, and may without any such application, put themselves in communication as soon as may be with such employer and workmen and invite the parties or their representatives to a friendly conference, and endeavour by mediation to effect an amicable settlement of the dispute, and if a settlement is effected a memorandum of the terms shall be drawn up by the board and signed by the parties or their representatives, and a copy thereof shall be delivered to each party or their representatives and the original kept by the board.

6. The application above referred to shall be an application made by the employer or by 10 per cent. or more of his workmen employed in the business or department of the business in which the trade dispute has arisen, or by his or their duly acknowledged agent or by both parties. Such application shall contain a statement of the matters in difference between the parties.

7. In case of failure to effect an amicable settlement as is above referred to, the board shall give public notice that they will hold an inquiry into the matters in dispute and invite all persons interested to attend and give evidence thereat.

8. The board at the conclusion of the inquiry shall make a report stating the causes of the dispute, the decision of the board as to the proper settlement of the dispute, and what parties (if any) are responsible for the same, and shall publish such report in any manner they may think fit.

9. For the purposes of the Act the board shall have power—

(a) To visit the locality where the trade dispute has arisen, and to hear all persons interested who may come before them ;

(b) To summon any person or experts to attend as witnesses or give evidence before the board ; and in the case of any persons summoned refusing to attend, to apply in a summary way to a justice of the peace having jurisdiction in the district for an order compelling such attendance, and such justice of the peace is hereby empowered to make such order ;

(c) To administer an oath to, or take an affirmation of, any

person attending as a witness before the board, and to examine any such person on oath or affirmation.

10—(1) The members of the board and the clerk (if any) appointed by them shall be paid such honorarium out of the funds of the County Council for their services as the County Council may from time to time determine, and they shall also be reimbursed out of the funds of the County Council for any expense incurred by them for obtaining professional assistance.

(2) The witnesses summoned by the board shall be paid their travelling expenses and such further sum, not exceeding ten shillings a day, as the board may think proper.

11. All payments authorised to be made by this Act shall be paid out of the County Council general assessment or rate of the nature of a general assessment of the district where the trade dispute has arisen. The County Council in each district is hereby empowered to raise funds for these purposes if necessary to do so.

12. The board in each district shall forthwith frame rules under this Act for the purposes of regulating their procedure. Such rules shall be submitted to and approved by the County Council, and may from time to time be altered by the board with the like approval.

AMERICAN ENGINEERS AND THE CHICAGO EXHIBITION.

A CIRCULAR note was issued in 1891 to every member of the American Society of Civil Engineers, asking for subscriptions to the sum of 3,000 dols. toward defraying the expense of maintaining suitable headquarters for the accommodation of engineers during the Columbian International Exposition of the present year. This sum has been fully subscribed, and the Board of Direction of the Society now find it necessary to call for a much larger subscription to enable it to perform the duty, which it has assumed, of the direction and management of the department of the Engineering Congress devoted to civil engineering.

Ninety-eight papers have thus far been promised, and others may yet come. These are distributed as follows :—From the United States, 36 ; Germany and Austria, 26 ; England, Scotland and Ireland, 10 ; Portugal, 6 ; Italy, 4 ; Holland, 4 ; France, 2 ; United States of Colombia, 2 ; Mexico, 1 ; Argentine Republic, 1 ; Russia, 1 ; Australia, 5. They cover a large portion of the subjects on which papers were invited, and most of them from the foremost engineers of the countries named.

St. Gabriel's Works, Erskine Street,
MANCHESTER.

Shorland's Inlet and Outlet Ventilator in every Design.

The preparation of plates, translation, printing, proof-reading, postage, &c., involve a large expense, and, if done well, must begin immediately. If but three-fourths of the number shall be received, and they average but twenty printed pages each, it will make two volumes somewhat larger than those of last year's "Transactions." In addition to this will be the discussions which may be had at Chicago. Limiting the estimate to the papers only, and allowing for an edition of 1,000 more than the usual number, the cost will be about 14,000 dols. If those volumes take the place of the "Transactions" for the last half of the year, the extra cost to the Society will be about 9,000 dols., or if we allow the very moderate sum of 3,500 dols. for printing the discussions, this would be 12,500 dols.

The board has appointed a committee to report upon the establishment of a bureau of information and courtesy at the Society's house in New York City, where visiting engineers on arriving may obtain information regarding points of interest in this country, and directions for reaching them. It is believed that such a bureau will prove an important factor in increasing the prominence and usefulness of our Society. The committee estimates the expense of establishing and maintaining such a bureau during the exhibition at 2,500 dols.

The Board of Direction, in view of these facts, deems it its duty to ask the members to contribute the sum of 15,000 dols. to meet the expenses mentioned. If every member contributes his proper quota, he will make sure of the reception of two valuable volumes from the Congress, the sum will be easily raised, and we shall have the satisfaction of thoroughly upholding the reputation of the Society, and doing well the work we have undertaken.

A later circular relating to the annual convention at Chicago states that it is impossible now to predict whether there will or will not be any difficulty in obtaining good accommodations at moderate prices, if each individual waits until about the time of the convention and looks out for himself. The general opinion in Chicago seems to be that there will be no great difficulty, and that the supply of rooms will more than equal the demand. There will be a great advantage, however, in having the Society located in a body at one large hotel, convenient to the Art Building, where the sessions of the world's congresses will be held, and at the same time within easy access of the exposition grounds. The Society is prepared to make contracts now, either on the European or the American plan.

The minimum rates at which first-class accommodations can now be secured are:—For room only, 3 dols. for each person per day; and for room with board, 5 dols. for each person per day. This figure is based on prices at well-constructed hotels within ten minutes' walk of the exposition grounds, and twenty-five minutes by rail of the art building; at least two persons to be in an ordinary hotel room, separate beds being provided. It is possible that cheaper accommodations than this may be secured, but at present it is not thought wise for the Society to undertake to provide them. More expensive rooms can now be secured by individual application to the hotels.

CONSTRUCTION IN QUICKSAND.

A LECTURE was delivered at the School of Mines, Columbia College, New York, recently, by Mr. R. L. Harris, C.E., on foundations, especially in regard to his method of hydraulic construction in quicksand and other fine materials. After alluding to various modern methods for difficult foundations as pneumatic, bucket dredged, contained caisson and the freezing process, the speaker described the especial subject of the lecture, structures in quicksand. He said that quicksand is a bane of engineers and builders. It has sunk millions of capital, and has caused the abandonment of extensive enterprises. I had known from observation that fine quicksand is widely scattered, but had no idea until recently that it is so extensively distributed. During the past six months I have received complaints of it from Puget Sound to Maine, and between the Gulf of Mexico and Canada, from the interior as well as near the great bodies of water. As cities build deeper, and municipal improvements go deeper still, we learn more of what is beneath than when our works were nearer the surface. The process of which I am to speak is proposed for upwards of twenty engineering substructures located in fifteen different states.

Upon some important work in Providence, R.I., an intercepting sewer 6 to 8 feet in diameter, a halt had been called on account of the quicksand encountered. The contractors for the worst sections claimed that it was ruinous for them to proceed and had petitioned the City Council to release them from their contracts and cancel their bonds, which was subsequently done. Nearly all the work and trials had been made by the usual methods of sheeting, excavating and pumping out,

Established nearly a Century.

reducing the water-level. These resulted in the sinking of considerable tracts of the original surface 4 to 5 feet, carrying down forest trees, building material, &c. Experience prompted me to consider the reverse of these processes, that of pumping in material which should solidify the troublesome quicksand in place, while in its normal condition and before injurious sub-currents should be established, in fact, to make it its own protector. The problem was separated into three divisions, which, as they represented unknown quantities to be obtained, we will designate by the algebraic characters, x , y , z . These were, then, x , to find a cementing substance, fluid or otherwise, that should unite with and solidify this extremely fine and light, yet compact and hard quicksand; y , to form channels and chambers at any depth underground and of desired form without extensive disturbance of the surface or the neighbouring materials; z , to fill such chambers and permeate the interstices of the adjacent materials with the cementing substance x . The divisions y and z comprised a pretty riddle. It was to put a fluid, say, 40 feet into the earth and below water-level in such a way that it shall mix with the material there for a defined area of, say, 12 by 30 feet, and solidify the same, so that if an excavation is made a month or a century hence that floor will be found as you now determine. Could a cementing fluid be forced through and into fine sand at a depth below the surface? Would it remain in a cavity already filled with incompressible water? Would it harden sufficiently within reasonable time under the buried conditions and in predetermined shape? Could the pipes be used and removed without being clogged or made useless? A trial was made on the work during the second week in March and in freezing weather, as bad as any experienced during the winter. The answers to the queries suggested were satisfactory. The results, despite the adverse circumstances, were successful, and fully demonstrated the method, and that it would be under complete control. The engineers and contractors of the work promptly and cordially expressed their satisfaction with the trial and their confidence in the new method. The result is that x , y , and z are determined both theoretically and practically. The ultimate results should be far-reaching and of great benefit. The method is applicable not only to quicksands but to other sands and the finer earthy materials. The applications are innumerable, enabling engineers and builders to make constructions in many of the fine, loose or soft materials, largely of the substances themselves, at any depth below the surface or of the adjoining material, as, for example,

shafts, tunnels, bridge foundation or canal repairs, waterworks, sewers, harbours, shore protections, jetties, buildings, &c., and perhaps there may be found herein the solution of a difficult problem in rapid transit for cities.

THE ST. LOUIS AND CHICAGO ELECTRIC RAILWAY.

THE contract has been signed for constructing the new line between St. Louis and Chicago, on which the motive power is to be electricity. It is proposed to operate from two or more power stations located at the mouth of two or more coal-mines situated along the line of route. These mines will be operated by means of electric-mining locomotives, electric drills, cutters and lights; and part of the coal thus cheaply obtained will be sold, while the rest will run the engines developing the electric power. The prospectus of the company gives the following details of the line:—"The road, which is 248 miles in length, will be divided up into twenty-five sections of ten miles each. The cars will run one section apart, and no current will flow in the intermediate section, so that it will be absolutely impossible for cars to come within ten miles of each other. This will constitute a complete block system, which will make it impossible for any two cars to run upon a single section at the same time, thus making collisions absolutely impossible. The road will be illuminated by incandescent electric lamps for one mile ahead and one mile behind every car while running at night. It will be built in a practically straight line. It will have no railroad or country road crossings at grade or on a level with its own line. The country roads are to be thrown up over the tracks of the Chicago and St. Louis Electric Railroad, by means of 248 wooden bridges, while the tracks of railroad will be thrown up over the crossing tracks of other railroads by means of seventeen stronger bridges. In addition to this, there will be no frogs or switches to break the main line and no drawbridges. The company will ultimately construct four tracks, two light-weight outside tracks for local traffic and high-class freight, and two heavy-weight inner tracks to be used exclusively for through passenger traffic, mail and express. At first, however, only the two through tracks will be constructed. The through cars will not stop anywhere between the two terminal cities between which they run. The standard schedule time of all through cars will be 100 miles per hour. The electric coach or car that will be run upon this road is long, low, compact and light, but strong,

having two pairs of driving wheels, each of which are driven by a separate and distinct electric motor. The whole weight of the car, with its passengers, and of the two electric motors comes upon these two pairs of driving wheels, and is, therefore, all available for adhesion between the rails and the wheels, through the agency of which the car is propelled. The top of the car stands only 9 feet from the rail, making it 3 feet lower than the ordinary street car. This brings the centre of gravity very low and near to the track, which makes it practically impossible for the car to jump the track. The car has a wedge-shaped nose or front for cutting the air, which has the effect of decreasing the atmospheric resistance and of helping to keep the car upon the track. The motorman stands immediately back of this wedge-shaped front, and between his department and the rear wheels is the compartment for the accommodation of passengers. In the rear of this is a separate compartment for mail and high-class express. The driving-wheels are 6 feet in diameter, and are capable of making 500 revolutions in one minute, which would give to the car a speed of over one hundred miles per hour. With this large driving-wheel the axle does not revolve at any higher speed than the axles under an ordinary passenger coach when travelling at fifty miles an hour; hence the friction will be no greater. In addition to this the axles will turn on roller bearings, requiring no oil. The weight of the entire car with its motors, will not exceed fifteen tons. These electric coaches or cars will be illuminated and heated by electricity, and will contain all the modern appointments for the comfort of passengers. It will be possible to stop a car within half a mile by means of the motors themselves, in conjunction with auxiliary electric and air brakes. The road will be operated by multi-phased alternating currents of electricity similar to those used at the Frankfort-Lauffen power installation at the recent Frankfort Exposition. Motors operating under this system require no commutators or brushes, and they may be so constructed as to be water and fire proof. An overhead electric construction will be used consisting of central poles and cross arms with a trolley wire running along the side of the car. This project is, in the main, founded on that which has been actually accomplished. For instance, the possibility of transmitting power electrically over long distances with economy was demonstrated at the last Frankfort Exposition, where 300 horsepower was transmitted electrically over a distance of 108 miles, with an efficiency of 75 per cent., and again the physical possibility of running a car at the rate of 100 miles per hour was demonstrated at Laurel, Maryland,

recently, where an electric locomotive weighing but $2\frac{1}{2}$ tons was propelled around a circular track $2\frac{1}{2}$ miles in circumference at a speed of 115 miles per hour without any derailment. It will therefore at once be seen, say the company, that there is nothing at all impracticable about an undertaking which contemplates the electrical transmission of power over only a 55-mile circuit, and the operation of 15-ton cars on a straight track at a speed of only 100 miles an hour." The promoters claim that the line can be worked at a very much smaller cost than a steam railway doing the same business.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.
All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

Head Office:—63 FORE STREET, LONDON, E.C. Branches at MANCHESTER, BRADFORD, BRISTOL and GLASGOW.

SELBY.—April 4.—For Additions, &c., to Burn Hall, Top House, Paper House, Haddesley Lodge, Farm Premises and Cottages. Mr. J. S. Ullathorne, Architect, Millgate, Selby.

VARIETIES.

THE Castle Mail Packets Company, Limited (Messrs. Donald Currie & Co., managers) have contracted with the Fairfield Shipbuilding and Engineering Company of Glasgow, the builders of the R.M.S. *Dunottar Castle* for the construction of another mail packet for the South African mail service, similar in character and style to the *Dunottar Castle*.

SIR CHARLES MITCHELL, K.C.M.G., the Governor of Natal, sailed by the Castle packet, *Hawarden Castle*, on Saturday for South Africa. Sir Donald Currie, K.C.M.G., M.P., is also a passenger by this steamer.

THE gift of a site for the erection of a public hall at Swinton has been promised by Canon Haywood, and a committee has been appointed to take steps for raising funds for the building. The estimated cost of the building is 3,000*l*.

THIRTY properties, having an upset value of nearly 150,000*l*., were offered for sale in the Glasgow Faculty Halls. There were sold eleven lots, realising 30,530*l*., being an increase of 1,122*l*. over the upset values.

THE committee of the Aberdeen Artists' Society are arranging for a course of lectures on art, to be delivered in the Art Gallery.

THE sub-committee of the Lord Provost's Committee of the Edinburgh Town Council, dealing with the subject of electric light, have drawn up a series of questions with the view to obtaining from Professor Kennedy additional information in supplement of his report.

A PORTION of Parr Old Hall, St. Helens, the oldest inhabited house in the district, collapsed on Saturday, the 25th, no one fortunately being hurt. According to local tradition, it was the ancestral home of Catherine Parr, the surviving wife of Henry VIII.

THE death took place on Sunday morning, the 26th inst., at his residence, Edgware, of Sir George Findlay, associate of the Institute of Civil Engineers, and well known for so many years as general manager of the London and North-Western Railway.

MR. SPEIRS, of Elderslie, has intimated to Provost Armour, of Johnstone, his intention of handing over a large field in the vicinity of that burgh to be used as recreation grounds.

THE death is announced of Mr. F. W. Smith, architect, Rochdale, at the early age of thirty-three years.

A SITE has been purchased in Willmer Road, Birkenhead, for building a new Presbyterian church at a cost of 2,500*l*.

AT the meeting of the Glasgow Architectural Association, Mr. Campbell Douglas, F.R.I.B.A., delivered a lecture entitled "Notes of a Visit to Spain and Portugal." By means of lantern slides various buildings of interest were illustrated in Lisbon, Toledo, Madrid and elsewhere, and reference made to peculiarities in design, materials, &c., of the native architecture. A number of pictures by Spanish artists from the gallery at Madrid were also shown by slide.

THE patrons of Hutcheson's Hospital, Glasgow, have agreed to offer to the Corporation of Glasgow the lands of Camphill, at the price of 63,000*l*., to extend the South Side Park, and to preserve the site of the ancient camp from which the lands take their name.

AN inquiry has been held by the Local Government Board in regard of proposals by the Corporation of St. Helens to extend the present main sewer from Ashcroft's Bridge at Parr on to the Double Locks, and construct outfall works for dealing with the sewage; for the erection of tar distillation works at the gasworks; for providing a branch library at Parr; and for the borrowing of 4,000*l*. for the erection of a smallpox hospital at Peasley Cross. The cost of the sewer and outfall works is estimated at about 25,000*l*.

AT the meeting of the Glasgow Philosophical Society, Professor Jamieson, Glasgow and West of Scotland Technical College, read a paper in which he discussed the advantages of "dry" cells over "wet" cells for bell-calls, telegraphic, telephonic and other purposes.

THE Works Committee of the Edinburgh and District Water Trust have adopted a plan and estimate and report for the construction of a regulating cistern at Craiglockhart, the estimated cost of which is about 9,000*l*. The cistern is to be 405 feet, ordnance level, and is to contain about one-third of a day's supply of water, the average supply from the North Pentlands springs being about four and a half million gallons per day.

THE umpire appointed in connection with the purchase of the London Tramways by the County Council, Sir Frederick Bramwell, C.E., has given his award, basing it on the value of the tramways as tramways, and not taking into account the

present and future profit-earning capacity of the lines, the sum awarded amounting to 64,540l.

AT the meeting of the Birkenhead Church School Extension Committee, it was reported that the committee had received promises of 6,500l. towards the fund for providing the additional school accommodation required in the borough; a sub-committee was appointed to secure a site for a new school that building operations may be commenced as soon as possible.

THE preamble of the Perth Improvement Bill, the object of which is to enable the Perth Corporation to carry out certain street and building improvements, and to borrow 75,000l. for the work, has been passed, and the Bill ordered for report.

THE Otis Elevator Company, Limited, has been formed to acquire the business, patents and goodwill of the American Elevator Company, at present carried on in London, Glasgow, Paris, Berlin and Vienna, that company being practically the European branch of Otis Brothers & Co., of New York. It is estimated that no less than 10,000 Otis standard hydraulic elevators are in daily use in the United States of America, and a very large number are employed in Great Britain, on the continent of Europe, China, India and the Colonies.

NEW waterworks for the Norton Local Board (Malton) have been inaugurated. The well from which the supply is drawn is situated at the foot of Home Hill, and the reservoir is at the top of the hill. The water is pumped up by a Crossley gas engine at 1,000 gallons an hour, and the reservoir holds 25,000 gallons. The water is then conveyed to the town by gravitation. Messrs. Fairbank & Son, of Westminster and Driffeld, are the engineers of the work; Mr. Bell, of Market Weighton, contractor for the reservoir; Mr. Villiers, of Beverley, for the well and pumping machinery; and Mr. Millington, Driffeld, clerk of the works.

THE Brewers' Sugar Company, Greenock, have arranged to erect large fireproof works for the manufacture of cereal products in West Burn Square, Greenock, at a cost of about 10,000l.

THE Corporation of Preston having provided a site in Corporation Street for a new technical college, the Council of the Harris Technical Institution have advertised for plans for the building, which is to cost "not more than 8,500l."

THE *Coventry Herald* says:—The erection of the new baths in Priory Street by Mr. C. G. Hill for the Coventry Corporation is making rapid progress. Men are now engaged

upon the roofs, and notwithstanding the fact that some delay has been caused by the confusion that occurred in regard to the tenders for roofs, it is expected that the building will be covered in within the next fortnight.

TRADE NOTES.

THE "Baird-Thompson" system of ventilation, after having been admitted to severe tests and inquiries, has been adopted for the new lunatic asylum, Armagh, by the Irish Office of Works. The company consider that this is a valuable testimonial as to the merits of the system.

AT the annual meeting just held of the Peterhead Feuars (Merchant Hospital, Edinburgh), it was agreed to supply the tower of the free library buildings with an illuminated clock.

MR. FREEMAN, of 200 and 202 Phoenix Street, St. Pancras, N.W., is introducing into the London market Peter Hurl's Cartliston firebricks, retorts, &c., made from the celebrated fire-clay of Glencoig. Specimens of these bricks were exhibited by Mr. Freeman at the Building Trades Exhibition, and although simply taken from stock and not picked or specially manufactured samples, as is often the case in exhibitions, their clean and regular make attracted considerable attention, not only of home consumers, but also of exporters, many of whom visited the exhibition. The high quality of these fire goods is unsurpassed by any other makes. They are capable of withstanding the most intense heat without contraction or expansion. They are largely used, with economy, in the Gorman, Siemens-Martin & Bessemer steel and copper furnaces, and we have no hesitation in predicting a large and increasing trade in these fireclay goods.

BUILDING EXHIBITION.

Britannia Company.

THE Britannia Company, of Colchester and 100 and 101 Houndsditch, London, show a novelty in band saws for cutting handrail wreaths, circle-upon-circle rails, dovetails and oblique cuts of every description. A valuable feature of this patent is the table constructed to tilt and also to revolve, the name of the apparatus being the Britannia Company's patent revolving-table band saw. This was shown with other useful appliances for woodworking, planing, thicknessing and moulding machines.

USED BY H.M. GOVERNMENT FOR THE LAST 12 YEARS
AND SPECIFIED GENERALLY WHERE FIRST-CLASS WORK IS REQUIRED.

Illustrated Catalogue can be obtained post free from the Inventors and Patentees,

WM. EDGCUMBE RENDLE & CO.

Westminster Chambers, 5 Victoria Street, London, S.W.

J. Kelly.

Kelly's patent telescope-ladders for all purposes where ladders are required, either for indoor or outdoor use, were shown by Mr. J. Kelly, of Winchmore Hill. One of these as a long ladder can be raised and lowered by one person. Although two or more ladders are employed in this patent, they occupy the space of one only when closed. They can be stored away indoors when not in use. These ladders are raised by means of an endless cord at the side, and securely lock themselves at every step on rising or lowering. They can also be used as fire-escapes.

C. H. Freyer.

The "Excelsior" oil purifying apparatus (Freyer's) was shown by Mr. C. H. Freyer of Bermondsey, as a valuable adjunct for all engine-rooms for purifying oil already used from dirt, grit, metal filings, &c., so that the oil may be used over and over again.

Joseph Kaye & Sons, Limited.

As mentioned last week, the model of an emergency exit was shown at the stand of Messrs. Joseph Kaye & Sons, Limited, of 93 High Holborn, the idea of which originated from an architect, Mr. Jacques (Newman & Jacques, Fenchurch Street). The Board schools where it is in use belong to the West Ham and East Ham School Board district.

Electrical Wonder Company, Limited.

The exhibit described last week was, it should have been stated, under the management of Messrs. Lichtwitz & Boss, not Lichtwitz & Bros., as printed.

Among other things exhibited were rustic summer-houses, by Messrs. H. & J. Caesar of Knutsford; carriages, &c., of all varieties by Messrs. C. S. Windover & Co., Limited, of Long Acre; Messrs. H. McMullen & Son of Hertford; bamboo work by Messrs. Fisher & Sharpe of Queen Victoria Street; oils and colours by Messrs. Pinchin, Johnson & Co. of Billiter Street; a woodcarving apparatus by the Pneumatic Woodcarving Machine Syndicate, Basinghall Street; wood-working machinery by Mr. Sydney Butler, Vauxhall, &c.

Messrs. Archibald Smith & Stevens write:—In the account of the Building Exhibition in your last issue, you notice a "new" self-sustaining lift exhibited by Messrs. Pickering & Co. An earlier description of this lift may be found in our patent specification, Stevens, Major & Edwards, No. 4,240 of 1882, illustrated in figs. 11 to 13, 16, 20 to 21, 24 to 25, and 26 to 28 in various forms. The sole difference is that our patent

describes rollers, and Messrs. Pickering & Co. use balls. We exhibited these lifts at the Building Exhibition of 1883 and 1884. The rollers gave trouble by wearing into flats owing to the slight slipping at the moment of taking up the grip and releasing. Other practical defects developed in working, and the patent was allowed to lapse some years ago. It has been repatented at least four times since.

THE FALKIRK IRON COMPANY.

"FALKIRK" is the title of the large and handsome volume issued as a pattern-book by the Falkirk Iron Company, of 67 Upper Thames Street, London, E.C., a firm well known as general ironfounders and manufacturers of every description of cast-iron goods. In such a business the goods manufactured are objects of utility and necessity. The tendency of the public at the present day is to have everything inside the house, and all pertaining to the outside and its surroundings as comely as possible, and therefore architects and builders have to look not only for good workmanship and good material, but for graceful appearance in addition. We think they will concede that the Falkirk Iron Company can satisfy all these requirements. We can only allude now to necessary and useful objects—even these are so numerous and diverse that a few only can be referred to—but of course there are many goods included in the business which are daily sought after by those who are not obliged to content themselves with bare necessities. The simplest and most necessary goods in iron can be made graceful. Some railway companies by their bridges have shown it is possible to erect hideous iron structures, but the existence of railway companies is bound up with the destruction of all that is beautiful. It speaks of everyday objects of use. The Falkirk pattern-book will be found to be full of beautiful illustrations of ironwork, from small to important household objects, and also out-of-door matters. It proves that a countless variety of charming designs can be produced in iron goods, and the treatment seems exactly what the architect would look for when metal is to assume graceful forms without disguising from the eye that it is metal. Nor can anyone complain of want of variety of patterns for individual objects, the selfsame article being shown in numerous designs of great beauty. To mention a few specialties must serve to suggest the long list of other goods that might have been mentioned. For instance, among the illustrations are very

gracefully designed railings, entrance gates, palisading, balcony work and panels, verandahs, staircases of all kinds for inside or outside buildings, for gardens; spiral, &c., staircase balusters and panels, staircase castings, &c., ventilating gratings, &c. Novelties and improvements in various goods may also be noticed in turning over the pages, but throughout all an artistic spirit pervades. A large choice and variety is also shown in kitcheners, ranges, and such like goods of all kinds, meeting any requirements, from those of a cottage to those of large mansions, hotels, &c.

Thirty or more plates in the volume are devoted to illustrating these. Without attempting to allude to them in more detail, attention may be called to the combined close and open fire-ranges, fitted with handsome tile-work. One of the improved novelties is the patent "fuel-saver" range, with open or close fire. Hob or boiling tables are illustrated, improved grilling stoves, self-acting and self-setting convertible close or open fire-ranges, &c. Equal variety and choice will be found in regard of fireplaces and register grates. Whether plain or ornamented, all are pleasing to the eye, and all the improvements of modern times seem to have been incorporated in them. One that "the lady of the house" will appreciate, no doubt, is the Nursery Register grate, a perfectly designed grate, with hobs, hot-water boiler, &c. The kerbs and fenders and other fittings show again a large choice in handsome patterns. Effectiveness in another direction is seen in the numerous illustrations showing each a different application of coloured tiles to registers and grates. The canopies also have been found to give facilities for enhancing the general pleasing effect. What is rather unique in design will be found in the one named "The Acanthus" grate. Chimney-pieces are illustrated with the same profusion; and also many samples of mantel register grates, also with overmantels. A full description is given of the patent controlled combustion air-chamber heating apparatus for houses and buildings of all kinds. Illustrations are given of the apparatus, and of a series of stoves for various purposes, and also of cooking stoves. Stable fittings, rain-water goods, ornamental castings, windows, casements, &c., we have made no mention of, nor of many of the other goods that ironfounders supply. Full as the book is of all kinds of these various goods, it is a surprise the amount of space that is devoted to illustrate in so many and varying patterns each object of a class. The designs, as we have before suggested, can speak for themselves, and we have pleasure in calling our readers' attention to the book.

IRRIGATION AND AGRICULTURE IN EGYPT.

ON Monday Colonel Justin C. Ross delivered a lecture on "Irrigation and Agriculture in Egypt," in Glasgow. He said he had served twenty years on the irrigation works in the Ganges Canal, and when the events in Egypt in 1882 rendered English interference necessary, Lord Dufferin saw the only way to put the irrigation on a sure footing was to get men who were acquainted with irrigation among Oriental populations to take charge of the matter. His lordship sent to the Government of India for men. Colonel Moncrieff was sent to prepare a report, and following on that the Egyptian Government demanded four men from India. He was one of them, and in 1885, after serving one and a half years in the Eastern Delta as an inspector of irrigation, he took over the whole charge of the Egyptian irrigation. He pointed out that at one time the Nile was no doubt a great arm of the sea, and then explained the conditions of its flow, how that it had a tendency to throw up ridges of alluvial deposit on each side, and that if it broke through one of those ridges at a bend in its course it made another bed for itself. There were no traces of any system of irrigation found in the numerous sarcophagi that had been discovered, but it was believed that King Mena, the first king of Egypt, who flourished about 4000 B.C., was the inventor of the basin system of irrigation, which was carried on up to 1835. Having explained the system that was adopted to fill and empty the basins, and the care that was necessary in sowing the wheat immediately on the water being allowed to run off, Colonel Ross said that when the Khedives went into the European market to borrow money—and the system of payment in kind had to be abolished for that of cash—then this plan of irrigation would not do. Better provision required to be made for husbanding and buying in of the water. Under the new method they had three systems of canals. There were the low-level canals irrigating the low lands; there were high-land canals piercing the spurs on the gravel ridges from the desert, which in Upper Egypt divided the basins from each other, and they had syphons or vamped culverts, by which they passed the water underneath the low-level canals at the end of the flood into the high-land canals and filled the successive basins. It took a rise in the river of $17\frac{1}{2}$ cubits to flood all the high lands. If the river did not rise above 14 cubits there was a disastrous failure of supply. It was the result of a water famine like this that overthrew Ismail Pasha in 1877, and brought to Egypt a blessing in disguise. It was at that time

JAMES HILL & CO., 100¹ Queen Victoria St., London, E.C.

that Mr. Baird, of Urie, went out to distribute the relief which it was found the Turkish governors were distributing into their own pockets. In these circumstances it was necessary to have such a hold on Egypt as would enable us to back up our engineers in their endeavours to keep the irrigation works in repair. About 600,000*l.* was the actual sum allotted for the ordinary expenditure on public works, but only 464,000*l.* was allowed for the repairs of the canals. This system of irrigation was exceedingly good so long as wheat was high in price, but America and India had cut that out, and other crops such as cotton, sugar cane and rice had to be cultivated. But the great bugbear of the Egyptian cultivator was the salt in the ground. He pointed out that during the summer evaporation took away the water but left the salt. When the Egyptian found his land getting salt the only way was to wash the soil by flooding it with fresh water, and one way of enabling that to be done easily was by the combination of the fellaheen and the proprietors to lay a certain portion under water. The lecturer then referred to the efforts that were being made for the reclamation of lands in the Western Delta and the system that was being adopted by the erection of dams in various parts of the river to secure irrigation during summer. He also referred to other schemes that had been mooted, but remarked that the carrying out of any of these depended upon the hold which this country might be able to retain over Egypt and the disbursement of its finances. He concluded by alluding to the views that were held as to Fayum being the site of the ancient Lake Moeris.

THE ARCH IN CONSTRUCTION.

THE word arch, derived from the Latin *arcus*, a bow, has been defined to be a concave structure raised upon a mould called the centreing, in the form of the arc of a curve, serving as the inward support of some superstructure, also as part of a circle less than a semicircle; as a hollow building raised upon a mould in the form of a semicircle; as a contracted vault; and as an artful disposition of stones generally in a bow-like form, by which the weight produces a mutual pressure and abutment, so that they not only support each other and perform the office of an entire lintel, but may be extended to a great width, and made to carry the most enormous weights. There being no word in the Greek language meaning an arch, it is inferred

that the object was unknown, although it has been said that the pediment of the Greeks suggested the arch, and it has been found in the Temple of the Sun, at Athens, and of Apollo, at Dydamus, concealed in the walls, covering the necessary openings, perhaps similar to discharging arches as now used by the moderns. In sacred history the arch is first mentioned in Ezekiel, chap. 40, v. 16, in his description of the Temple. "There were narrow windows to the little chambers, and to their posts within the gate, round about, and likewise to the arches, and windows were round about inwards, and upon each post were palm-trees," B.C. 574. The bridge over the Euphrates, at Babylon, Herodotus expressly says, was built on stone piers bound with lead, and lintel or squared beams of timber. The tunnels also at Babylon, mentioned by Diodorus Siculus, were probably covered in the same way. Visconti, on the authority of Plutarch, assigns the invention to Alexander himself, who lived B.C. 323, or about a century after Herodotus; Dr. Pococke thinks the Egyptians were unacquainted with the arch, although Belzoni found Egyptian arches at Thebes and one at Gouinon, leading to the valley of Beban el Malook, and Diodorus Siculus, in describing one of the celebrated buildings of Egypt, takes particular notice that it was tipped with one stone; Sir John Chardin, in describing the subterranean passages at Tohelminar, does not in any way allude to the arch, a circumstance he would not have omitted if it had been the case; one tomb is said to be arch-roofed, but it is in solid rock. The Romans have the merit of being the first to introduce the arch into general use. The earliest on record is the conduit at Tusculum, near Rome, 16 feet wide and 30 feet high. The second, the theatre of Marcellus at Rome, built in the time of Julius Cæsar, where semicircular arches are found, and it may with truth be said a genuine arch did not exist prior to the time of the Romans. The arch was not known in Greece, and there is doubt of its being used at Babylon, or Assyria, or in Rome, earlier than the time of Cæsar, B.C. 50. In the quotation given from Ezekiel probably the true arch is meant, as the impost was the earliest ornament in arches of stone, and that, too, with leaves resembling those of the palm. This would place the invention nearly 500 years previous to the time of Cæsar. Again, the absence of any remains is a great obstacle to the latter conclusion, so that we must be content to allow the merit to the Romans of bringing the arch into general use, but the extent of its application was reserved for modern times, as Waterloo, London, Gloucester, and Chester Bridges amply testify.

Established 1875. Telegrams: "Orchard."

There are the following forms of arches in use: the date of their introduction is almost as uncertain as the origin of the arch itself:—Tudor arch, called after the name of the reigning family; arched dome, which arose in Etruria; semi, or Roman, in exclusive use until the twelfth century; horse-shoe, or Moorish, more than a semicircle, found in East Morgan, a building of the Anglo-Normans; elliptic, first found in the tower of the Deanery of Lincoln, 1500; inverted arch, found in cathedral of Wells and Salisbury; catenarian, or arch of equilibration; scheme or skene, or imperfect arch, less than semicircle; hyperbola, and parabolic, from sections of a cone; trochoid, or cycloid, invented by Descartes, 1615; epicycloid, formed by motion of a point in a paddle-wheel of a steam boat, a combination of circular and progressive motions. There are twenty-two varieties, drawn from four, six, and eight centres. Straight arch, or plat-band, with joints converging to a common centre; examples are in Lincoln Cathedral and Greenwich Hospital. Vaulting or groins, the latter arises from the intersection of the former, about the fourteenth century. Rampant or flying arch, used to connect buttress and pinnacles with the main building.

The proportion of parts has generally been estimated in parts of the span or chord, and one-fifteenth, one-twenty-second, up to one-thirty-fourth, has been stated as the proper depth for the voussoirs at the crown or apex—the thickness of abutment one-sixth of the span, and of the piers one-sixth. The rise or versed sine should not in any case be less than one-quarter of the chord. When the height of the piers exceeds the rise of the arch, an addition of one-fifth (if their size be estimated by the previous standard) is made to their thickness, and when the span of the arch exceeds 50 feet, it is usual to increase the voussoir, as the abutment or skewback is approached. The success that attended Brunel's bold experiment of the Maidenhead bridge, carried into successful execution amid the sneers and jibes of his compeers, in the application of brick to a span for which no stone save granite was considered competent, augured favourably for the use of arches of brick to an extent never before contemplated, especially where high banks offer the additional inducement to try the effect, there being then no approaches to make. The Maidenhead bridge was turned in half-brick rings in cement, 5 feet 3 inches in depth at the crown, and 7 feet 1½ inches at the springing; the two main arches were elliptic, and 128 feet span, with a rise only of 24 feet 3 inches; the land arches 21 feet and 28 feet span, there being six of the latter on one side and two of the former

on the other. The immense mass of 7 feet in depth of brick in the arch was the true source of security.

LONDON COMMERCIAL BUILDING SOCIETY.

At the twenty-ninth annual meeting of this Society recently held at the Inns of Court Hotel, Holborn, Mr. William Hurren, chairman, presided, supported by Messrs. John Yarde, Giles Yarde, C. H. F. Lewes, J. Wear, W. F. Potter, &c. The Chairman moved the adoption of the report, which stated that in consequence of a "run" on metropolitan and other building societies, the directors deemed it prudent in September last to discontinue the society's business for two days, after which they resumed business as heretofore, with the exception of the banking department. Notwithstanding the temporary suspension of the society's business, it afforded the directors much gratification that they had been able to place a sum of 579*l.* 8*s.* 10*d.* to the special reserve fund, thus raising that fund up to 900*l.*, to write 91*l.* 12*s.* 9*d.* off the lease of the Society's premises and to recommend the members to declare a dividend of 4 per cent. per annum. The total amount of profit allotted to depositors and members for the year is 2,566*l.* 8*s.* 3*d.* The Chairman said the Society had always been eminently successful up to last year, when in consequence of the disastrous events which happened and which now were so well known, they had received a number of notices from their members. Dr. Johnson's definition of a panic was, "a fright without a cause," and the Chairman thought that there was no cause for the members to be frightened.

Mr. W. Conway seconded the resolution.

Mr. George Rayner, auditor and accountant, said he had made a thorough and searching examination of the accounts of the Society and was able to congratulate the members on the businesslike manner in which the books were kept. In his opinion the directors were fully justified in recommending a dividend of 4 per cent.

Mr. W. Simpson, auditor, endorsed all that had been said by his colleague, Mr. Rayner.

Mr. W. J. Wetenhall, L.C.C., said that the statement of the auditors was very satisfactory. He thought the directors were taking a wise step in deciding not to put the properties on the market while they were yielding a good profit. He was glad that it had been decided not to continue the banking business. At the time of the panic he gave notice for the withdrawal of his money, but after a conversation with the directors and

secretary he was firmly convinced that the Society was in a sound position, and therefore cancelled the notice.

The motion was then adopted unanimously.

Mr. Pearson moved and Mr. Everett seconded the re-election of the members' auditors, Messrs. W. Simpson and C. J. Weston, which was carried unanimously, and Mr. Simpson returned thanks. The withdrawal notices had amounted to 21,000*l.*; he trusted, however, that by the middle of next June every depositor who had given notice would receive his money in full.

Messrs. W. Hurran, W. Conway, W. F. Potter and J. Wear, the retiring directors, were then re-elected on the Board.

The Chairman, in returning thanks, said he was interested in the Society to a large extent, amounting to about 6,000*l.* He felt quite confident that his money was safe.

Votes of thanks were passed to the chairman, directors, secretary and solicitors, and the proceedings terminated.

VARIETIES OF SPIRES.

THERE are many peculiarities in spires. First, as regards its base, a spire may be said to be cluster-based when surrounded below with pinnacles connected with it, and from among which it seems to spring up; of which kind St. Mary's, Oxford, is a celebrated example. The Hôtel de Ville at Ypres has a spire clustered with four exceedingly tall pinnacles or lesser spires. Where there are windows placed against a spire, rising upright like the dormers or lucarnes on a roof, the term lucarnes would express that character; hence it has been applied, among others, to those of Lichfield Cathedral, which have several tiers of such windows, and are described accordingly. Crocketed and banded are terms requiring no explanation; but in regard to the first it may be remarked that spires, otherwise quite plain, are sometimes ornamented with crockets along their edges; and with respect to bands, they are sometimes little more than string-mouldings, but in other cases broad and enriched surfaces. Many of the spires in Normandy are ornamented with such a number of bands that they form alternating courses with the plain spaces between them. Finialled is a term which does not apply to any of our English spires, but that of St. Stephen's, Vienna, and some other continental spires, have an exceedingly large and rich finial, which ornament gives them a particular boldness of expression. The

tabernacle spire also is one of which there is no example in this country, but of which the one just mentioned, and those of Strasburg, Ulm (as designed), Thann in Alsace, and many others, are specimens, the tower and spire being carried up from the ground in a succession of diminishing stages, all profusely adorned with panelling, niches, canopies, pinnacles and other tabernacle work, in such a manner that it is barely possible to distinguish where the upright portion or tower terminates and the spire itself begins, the latter seeming little more than the uppermost stage in continuation of the rest. Neither have we any instances of open-work spires, or of such as, if not actually perforated, are yet entirely covered with tracery. That at Freyburg, and those at Burgos and Batalha, are all exceedingly rich specimens of the kind. The chapter-house of Burgos also has a series of very large pinnacles or small spires of tabernacle character. Cambrai and Esslingen on the Neckar afford other examples of open-work spires. There are various other circumstances which, though they do not affect the spire itself, produce greater or less difference in regard to the character of the structure of which it is a component feature. Very much, for instance, depends upon its situation in the general plan: at Salisbury, Norwich and Chichester the spire is raised upon a tower at the intersection of the cross, or in the centre of the plan; whereas in most continental cathedrals and large churches there are two spires on the towers of the west front, though in some instances (Strasburg, Antwerp) only one has been erected. Several, however, have a single tower and spire in the centre of the west front (Ulm, Freyburg, Thann in Alsace), in which case the tower itself begins to diminish almost from the ground, and the whole becomes what we have described as of the tabernacle character. In most of our English churches (not cathedrals) the spire is placed upon a tower at the west end, as at Grantham, Louth, Bloxham, &c. If we except Peterborough, where they are very diminutive, the only English cathedral which has two western spires is Lichfield, which is further remarkable as having a central tower and spire also. Besides the richness and variety thus produced, the larger central spire serves to balance the whole composition, whereas else the body of the structure is apt to look low in comparison with the west end. At St. Stephen's, Vienna, the tower and spire are singularly placed on the south side of the edifice, it having been intended to balance them by a corresponding tower on the north side. At Gelnhausen, on the contrary, there is a group of spires, as already noticed, at the east end.

THE ECCUP EMBANKMENT OF THE LEEDS WATERWORKS.

THE chairman of the Leeds Corporation Waterworks Committee (Alderman Alf Cooke) invited the members of the City Council, a few days ago, to an inspection of the Eccup Reservoir, where the work of reconstructing the puddle-trench is now in progress. The principal reason for the visit, says the *Leeds Mercury*, was that a contract, involving an expenditure of 26,000*l.* for further works in connection with the reconstruction of the embankment, has recently been let. The puddle-wall has now been filled in to the extent of 30 feet at the north end and of 18 feet at the south end. The difficulty arising from the presence of water, which has hitherto found its way into the trench, has been left behind at this level, and from this point to the completion the work will be more simply and more rapidly done. Pumping operations are still carried on, the water-level being thus kept below the bottom of the newly filled-in puddle-wall, so as to allow the latter to become firmly consolidated before being subjected to the effects of the water. The trench is altogether 180 feet deep. This is, for one-half of its length, some 30 feet deeper, and for the other half 105 feet deeper, than it was when originally constructed. The new puddle-trench will, therefore, have practically a level bottom throughout, whereas formerly it was of two depths—one 75 feet and the other 150 feet. The result of the excavations has been to prove that the water, whose escape rendered the present works necessary, had escaped from the reservoir under the shallow or 75 feet puddle-wall, and, finding its way to the deep puddle-wall, was gradually wearing the end of the wall away, and percolating through the remaining portion of the embankment. Indeed, it washed out of the deep puddle-wall a cavity about 100 feet long, and the cement which was employed in the effort to stop the leak ran into this cavity like a mould, spreading itself over its entire length and forming a species of wall 20 feet high, which added considerably to the stability of the embankment. Unfortunately, however, this was not the only difficulty with which the engineers had to cope. Even the deep puddle-wall had not been carried to a sufficient depth, and it was found that it was not resting on a water-bearing stratum. Hence it has had to be deepened, as before stated, to the extent of some 300 feet. It is for this reason that the further digging

out and reconstruction of the embankment has been found necessary, and the contract, which, as stated, amounts to 26,000*l.*, has been let to Mr. Gould, of Leeds, who will commence operations within the next month. When this contract is completed there will still remain a portion of the embankment that may require to be dealt with. The actual condition of this portion can only be ascertained as the progress of the excavations which, as stated, Mr. Gould will shortly commence, renders its examination possible. It is hoped, however, that with the completion of Mr. Gould's contract the trench will be finished. The great feature of the new puddle-wall is that the end of the wall, which was, under the old condition of things, worn away by the water, is now being constructed in solid brickwork right from the bottom to the top. In addition to this there is a brick-built spur, projecting 10 yards into the reservoir at a right angle from the end of the puddle-wall, and the water will have to find its way round this spur before it can get into the valley below. And should the water find its way round the spur it will leave a still surface at the embankment, which will be a great advantage. The time which the remainder of the works will occupy is variously estimated, but it is likely that three or four years will be required for their completion, and it will then take another twelvemonths to fill the reservoir. The water supply of Leeds is now being brought by temporary lines of pipes running around the reservoir into the old Blackmoor Tunnel, and thence to the Weetwood filter beds. The new Blackmoor Tunnel works are progressing very rapidly to completion, and the city engineer reports that they will be finished within six or seven weeks.

LEEDS SANITARY AID SOCIETY.

THE report of the first year's work of the Leeds Sanitary Aid Society is as follows:—The society was formed in pursuance of a resolution passed at a public meeting held in the Mayor's Rooms, on January 13, 1892, and convened by the Vicar and other gentlemen interested in the well-being of the town. It was presided over by the Mayor, and attended by a number of the most prominent citizens of Leeds, including members of the Corporation and Sanitary Committee. An executive committee was elected, under the chairmanship of the Vicar of Leeds, and this committee has met about once every three weeks, and by the courtesy of the authorities has been allowed

the use of a room in the Town Hall, The first practical effort of the committee consisted of an examination and report upon the condition of 100 houses in various parts of the town, from which children had been sent into the country by the Children's Holiday Fund Committee. Following on this, one of the most thickly-populated parts of the east end of the city was mapped out into sub-districts, and almost every house in this area has been inspected by members of the committee, either personally or by deputy. Later on two further districts—one in Hunslet, and the other in Holbeck—were undertaken, but sufficient time has not elapsed to receive reports from them. In the east district 351 houses were reported to the society, of which 80 were reported to the Sanitary Committee as having distinct sanitary defects. These have been recently re-inspected, and in 21 cases remedial action has been taken; in others notices have been served upon owners, while in 17 cases the visitors report that nothing has been done. All the visitors sent in numerous complaints of smells arising from street and yard gullies. The attention of the Streets and Sewerage Committee has been drawn to this matter, and we hope that in our next report we shall be able to note that some action has been taken. We regret, however, that up to the present we are unable to learn that the pattern of gully has been altered even in the case of those newly inserted. The next fact of importance arising out of our visitors' reports was the gratifying one that in a large number of cases an external had been substituted for an internal connection with the main sewers. But your committee were much struck with the anomaly that while the sanitary authority were carrying out this improvement, the Streets and Sewerage Committee still authorised the building of back-to-back houses, with an internal connection to the main sewers, the more so as they themselves mark their disapproval of the system by insisting that no through houses shall be so built. A deputation of your committee therefore waited upon the Streets and Sewerage Committee, and received the Chairman's assurance that the views of his committee coincided with those of the deputation. Leeds is the only large town which, in England, has not taken advantage of the Infectious Diseases Compulsory Notification Act, and it was felt by your committee that the adoption of this Act by the Council would greatly strengthen the hands of the medical officer of health in counteracting the spread of infectious disease. Inquiries were therefore made in various towns, and a unanimously favourable opinion having been expressed both by the chairmen of the sanitary committees and the medical officers

of those towns, the matter was brought by deputation before the notice of our municipal sanitary authority. The Chairman informed the deputation that his committee, as a whole, was favourable to the Act, and we therefore hope to hear shortly of its adoption. The serious evils connected with the cloud of smoke which hangs over Leeds call urgently for remedy. A committee of ladies and gentlemen, formed with the object of dealing with this question, has been affiliated to your society, and on February 27 a largely-attended public meeting, presided over by Colonel Harding, was held in the Philosophical Hall, and was addressed by Mr. Herbert Fletcher, of Bolton, and Mr. Mellor, of Oldham, who explained methods by which factory smoke may be, and, in the case of Mr. Fletcher's own boilers, is being, reduced to a minimum. Mr. Ambley, the city smoke inspector, who has already done a great deal for the prevention of smoke in Leeds, visited Bolton, and expressed a most favourable opinion of the apparatus in use at Mr. Fletcher's colliery. In conclusion, the committee feel convinced there is ample room for such a society as this, which endeavours steadily to bring into notice the serious defects which still impair the sanitary condition of the city.

The balance-sheet showed receipts 22l. 3s., with expenditure 20l. 12s., a balance of 1l. 11s. thus being left.

THE BUILDING TRADES IN BIRMINGHAM.

THE *Birmingham Post* says:—All who are interested in the Birmingham building trade will have a vivid remembrance of the protracted struggles which took place last year upon the wages question between the master builders and the bricklayers and bricklayers' labourers; we are, therefore, glad to learn that the even wider struggle which threatened to take place in the ensuing spring is likely to be averted. The bricklayers and labourers succeeded last year in obtaining an advance in wages, and their success has led to a demand for an increase on the part of the carpenters and plasterers, which was accompanied by an intimation from the masters of an intention to reopen the question as between them and the bricklayers and labourers. In accordance with the rules governing the various branches of the trade in their relations with the employers, six months' notice has to be given for an alteration of the standard wages list, and under this agreement the carpenters and plasterers last October gave notice that on and after April 1 this year they should expect an increase of one halfpenny per hour. stonemasons gave a notice in reference to an alteration of the working hours, and an intimation was made by the carpenters that they required an alteration of the period from which overtime should count. The masters, on their part, informed the bricklayers and labourers that they would be asked to consent to a reduction, lowering their wages to the level they stood at prior to the strike of 1892. At the time the notices were given considerable uneasiness prevailed as to the probable result, and it was freely prophesied that a general strike would take place. Fortunately both sides approached the difficulty in a spirit of calmness, and with a desire to arrive at an amicable conclusion. Numerous meetings have taken place in the interim, with the result that the points at issue have been reduced to such small dimensions that conciliatory means should result in their removal. So far the masters have agreed to waive their notices to the bricklayers and labourers, and, with a spirit of generosity, have, we learn, granted the increases to the carpenters and plasterers. Some dissension, however, appears to exist in relation to the question of hours and the matter of overtime, but as this is limited to one branch it is to be hoped that in the interests of an industry which is now entering upon the busiest period of its yearly activity, and considering the concessions of the masters, a friendly termination will be arrived at. Speaking generally, the building trade is not so flourishing in its prospects now as it was at the corresponding period last year, for during the winter months building operations, wherever practicable, have been rapidly pushed forward, so as to avoid the delay which would have resulted from a strike. Business will therefore be slacker than usual especially in connection with house-building, and neither party will have anything to throw away.

SALFORD DOCKS, MANCHESTER SHIP CANAL.

SOME interesting work, says the *Manchester Guardian*, is in progress at the Salford docks. Hitherto these docks have presented the appearance of simple oblong basins, shaped in granite, with walls rising to a clear height of over 30 feet. The process of filling in these empty spaces with river water has commenced. The water will have a depth of 24 feet, which is within 2 feet of the ordinary water-line to be observed when the canal is completed. The flooding to this level is merely to serve a temporary purpose, and when this is accomplished the water will be allowed to sink by some 8 feet or

10 feet. Meanwhile the docks will have the look which we shall grow familiar with at some future day. The picture, seen from Old Trafford or from the long wharf which has been built at Stretford, will be that of a great inland lake, and nearly all the masonry of the docks will be lost to sight. The immediate object which the engineers have in view is to float a couple of huge dredgers, which were constructed and put together in the shipbuilding yard of Messrs. Fleming & Ferguson at Paisley. If they had been meant for the lower portion of the canal they would have put to sea—for, clumsy as they appear, they are capital sea-boats—and sailing up the Mersey would have entered the waterway by the locks at Eastham; but having to do service at the Manchester end of the canal, it was necessary to take them in pieces and send them overland from Paisley. For the past few months the work of rivetting and painting has been in progress at the Salford docks. A hundred and more hammers have been ringing the day through, and altogether there has been noise and activity at the docks of a character to suggest a Clyde shipbuilding yard. The work being completed, the next task was to float the *Irk* and the *Medlock*—for so the dredgers are appropriately named—and that is the business which has been taken in hand. The operation is not quite the easy thing which a simple statement of the methods adopted would lead one to imagine. There are many possibilities of mishap, and what might seem a small accident may lead to serious results. The river runs its course from Salford to a point below Barton in the main channel of the Ship Canal, the diversion having been made about a year ago. The bottom of the docks corresponds with the bed of the canal, but there has been a dividing wall in the shape of a dam of earth, some 600 yards long. In view of the flooding of the docks, the dam was reduced to fine proportions, and then at two points an embrasure was made to permit the river-water to enter. Flowing in, the water would soon reach its level on both sides of the dam. In order to float the boats, however, it was essential to raise the height of the water very considerably. This has been done by shutting the sluices and closing the lock gates at Mode Wheel, about half a mile below the docks. The process has been carried out, and its practical effect was to place a dead wall at this point in the river. At a time when the rains have been heavy and the tributary streams in the higher reaches of the river send in their flood waters this course might seem somewhat risky, for strong indeed must be the barrier which could resist the flow. Even as it is, with the Irwell moving sluggishly towards the

VOLUME XLVIII. OF THE ARCHITECT.
Handsome bound in Cloth, Gilt Lettered, price 12s.
Office: 175 Strand London, W.C.

sea, the pressure must be enormous, and the great gates of greenheart will feel the strain, although they are fortified by water within the gates maintained at a high level. Between Mode Wheel and Salford the river rose steadily at the rate of about 4 inches an hour. Probably this standard will not be maintained. The *Irk*, which is the more complete of the two vessels, will pass through the locks at Mode Wheel, and get to work between there and Barton. The dredger *Medlock* will remove the dam at Salford, and accomplish such other excavation as is required.

It should be said that the dredgers have a complement of twelve steel barges. Each barge is constructed to carry twenty boxes, with a capacity of 4 cubic yards each, into which the dredged material is received from the shoots of the dredger. When filled the barges are taken to an adjoining wharf. By means of a patent crane the steel boxes are there lifted out, and the excavated stuff is tipped into waggons and run to spoil. This system has been in operation for some months at Ellesmere Port and Millbank. The barges are 106 feet long by 18 feet beam, with a draft when loaded of 4 feet 3 inches. They have been built by Messrs. Gilchrist & Co., of Liverpool. The dredgers which feed the barges are capable of lifting 500 tons of ordinary material in the hour. Each vessel is 132 feet in length, 37 feet in breadth, and 10 feet in depth. The engines are 350 indicated horse-power. The system of dredging in the approach channel to the Eastham Locks is of a different character to that described. Here the practice is to shoot the material lifted, whether it be semi-fluid silt or hard rock, into hopper barges. The barges are taken to sea beyond the Mersey Bar Lightship, and there they drop their loads. The Ship Canal Company have no less than ten dredgers at work, the two of greatest capacity lifting 800 tons of ordinary material per hour. All are of the "bucket-ladder" type. The following catalogue of additional plant may not be without interest for some readers:—Nine steam grabs; two steam hoppers, each with a capacity of 600 tons, three of 350 tons, and two of 140 tons; ten towing hoppers, varying from 185 to 400 tons; eighteen steel barges, each with a capacity of 120 tons, and six of 60 tons; fifty-seven wood-punts and barges; twelve steam-tugs; seventeen steam cranes; twenty-two locomotives and 550 side-tip waggons.

In connection with Ship Canal matters, it may be interesting to state that the various deviation lines recently passed into possession of the different railway companies. The Cheshire Lines Committee, having used one of the lines for goods traffic

for about a month, have opened it for passengers, altogether waiving their right to use it for six months for goods traffic only. The old Irlam Station will not see any more trains. A fine new station on the higher level has been opened. The action of the Cheshire Lines Committee will very considerably facilitate the work of the contractor and of the company.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 5362. Spencer Venables, for "Improvements in instruments for assisting drawing in perspective."
- 5439. William Wagstaffe, for "Improvements in construction of column to maintain upward air-current."
- 5559. Thomas Edwin Jones, for "Slides for all descriptions for windows to dispense with cords, pulleys or weights, applicable to anything on a sliding scale or thereabout."
- 5705. Frederick William White, for "Improvements connected with reversible sashes and in sash frames there for."
- 5835. Rowland Priest and William Morrall, for "Improvements in automatic brakes for pulley blocks and hoists."
- 5380. Henry Newman Godward, for "The anti-down-draught smoke cure."
- 5389. Arthur Bryce Mees, for "A new or improved instrument or machine for weighing and indicating the value of commodities or articles weighed."
- 5427. George Law, jun., for "Improved means for ventilating house drains."
- 5386. Marian Charlotte Pincoffs, for "Improvements in ventilating appliances for windows and the like."
- 5535. Robert Astley, for "An improvement in the construction of fireproof floors."

TRADE NOTES.

THE Nuneaton Cottage Hospital is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

MR. THOMAS YEOMAN, of Osmotherley, has placed a large memorial clock, with all the latest improvements, in the tower of the parish church, in memory of his father. The clock shows the time on a large outside dial, which is painted and gilt, and strikes the hours on the large bell and the quarter-chimes on two smaller bells. The necessary work has been carried out by Messrs. Wm. Potts & Sons, of Guildford Street, and Cookridge Street, Leeds.

THE judges of the Universal Exhibition, Monaco, have awarded the Yost typewriter the gold medal and diploma.

THE Ashchurch Schools, near Tewkesbury, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

THE Edinburgh School Board adopted a report submitted by Mr. Ballantyne with the following estimate of the probable total cost of providing the Bruntfield School and site, &c.:— Estimate of Messrs. Moodie & Co. for the mason, brick, joiner, iron, slater, glazier, plumber and plaster works, &c., 21,479*l.*; estimate of Messrs. Mackenzie & Moncur for heating and ventilating and providing chimney and boiler-house, 1,702*l.* Probable estimates:—Furniture and fittings, &c. (as per

WE have received some new illustrated catalogues and price lists from the Edison & Swan United Electric Light Company, Limited, which will be referred to more at length in a following issue. They include lists dealing with incandescent lamps, installation fittings for electric lighting and electric light measuring instruments, and which we can recommend for perusal to any interested in works pertaining to the use of electric light.

VARIETIES.

THE first of a series of lectures under the auspices of the Aberdeen Artists' Society has just been delivered by Mr. W. M. Gilbert, of Edinburgh, the Marquis of Huntly presiding. Mr. Gilbert treated on the rise and development of French art, which showed them that they could not at once rise to be an artistic nation, and could not hope in Scotland and England to rise to the level of France in a moment, but it also taught them that it was education, learning, thought, study of nature, not condemnation of impressionism, and not the run after romanticism in all its various forms, but it was the study of nature and the love of art that produced artistic ideas.

TWO of the British Royal Commissioners, Mr. James Dredge and Mr. H. Harris, sailed for Chicago on Wednesday in the interests of the British section of the coming exhibition, and to attend the opening. It is believed that Sir Edward Birkbeck and Sir Douglas Galton will also go to Chicago later in a similar capacity.

WE understand that Mr. Santo Crimp, M.Inst.C.E., has resigned his appointment of district engineer to the London County Council, and has entered into partnership with Messrs. John Taylor & Sons, civil engineers, of 27 Great George Street, Westminster. Mr. Crimp is a recognised authority on all matters relating to municipal engineering, is the author of many papers on sanitary engineering, and of a standard work on sewage disposal, while his partner's were for a long time connected with two of the London water companies, and have for a number of years past acted for many of the provincial

water companies; they are also authors of a well-known work on the discharges of water-mains.

A SUBSIDENCE, due to mining operations, occurred in Belper Row, Darby Hand, Netherton, near Dudley, on Friday night, with the result that four tenanted houses were seriously damaged, and one, also occupied, completely wrecked. Subsequently another house has begun to collapse, the tenants speedily evacuating the premises.

THE municipality of Havre, in concert with the medical authorities, are organising an international sanitary exhibition.

AN electric pumping plant with a capacity of 2,000,000 gallons per twenty-four hours is to be started at the San Antonio Waterworks, Texas, by the Gould Manufacturing Company, of Seneca Falls, New York. The pumping plant is to be increased to 10,000,000 gallons daily capacity, and current will be generated at a point three miles distant, where water-power is available.

A COMPANY at Naples are preparing a mosaic, representing the return of Columbus to Spain, for Mr. Furber, of Chicago, who is building in that city a Columbus Palace, and which will be the largest private house in America. The mosaic measures about 200 square feet, and is designed by Cavaliere E. Paoletti.

JUDGMENT has been given by Sheriff Campbell Smith in an action by Mr. James Sime, house agent, Laurel Cottage, Queen Street, Broughty Ferry, against an order by the Dundee Police Commissioners that he should put a house in Brown Street, Dundee, belonging to him, in a sanitary and habitable condition. His lordship finds that the deliverance by the commissioners cannot be sustained, and finds the appellant entitled to expenses, modified to 3*l.* 3*s.* In a note his lordship says his condition is that there are thousands of worse houses than this one in cities in Scotland, and that in the country districts the majority of houses inhabited by working men and their families are not so good. Overcrowding, want of accommodation to secure the decencies of life, want of means of cleanliness, were all great evils that ought, as far as possible, to be cured, but they would never be cured by shutting up houses that were not intolerably bad or unhealthy.

THE works for the new water supply of Haddington have been commenced. The new scheme will more than double the present supply, and the town will be indebted for this to the Marquis of Tweeddale, who has met the burgh in the most generous manner. The distance of the pipe track will extend to over six miles, and the estimate accepted for the cutting of

the track is 2,193*l.* 14*s.* 6*d.*, the contractors being Messrs. John M'Knight & Son, Uphall, Linlithgow. The difference between the highest and lowest offers was 1,400*l.*

THE *Manchester Guardian* says:—We learn that the works in connection with the electric lighting of Moss Side will be begun in the course of the next few days. The local authorities hope to have the new light in the Whalley Range residences as well as in the principal shops and streets by next winter. A telephonic exchange will shortly be established in the township.

THE joiners of Colne have gone on strike, the masters refusing an advance of wages from 7*d.* to 7½*d.* per hour.

AT the meeting of the Preston Town Council a recommendation of the Town Improvement Committee that certain property on the north side of the market-place should be purchased for 9,000*l.* was confirmed. This was the last purchase necessary to entering on the work of public improvement, and the committee would not lose a day in entering upon it. The Ribble Committee decided to purchase a sand-pump similar to those in use at the Mersey bar for 1,295*l.*; to construct a siding on the north side of the dock at a cost of 1,200*l.*, and various other works.

FOUNDATIONS OF THE TOWER BRIDGE.

AT the ordinary meeting of the Institution of Civil Engineers on March 28, 1893, a paper was read giving an account of the methods adopted in the construction of "The Foundations of the Two River Piers of the Tower Bridge," by Mr. G. E. W. Cruttwell, M.Inst.C.E.

Owing to the weight of the lofty towers supporting the suspension-chains of the shore-spans and the high-level footways over the opening span of the bridge, the dimensions of the foundations, with a load of 4 tons per superficial foot, worked out to 100 feet in width by 204½ feet from end to end of the cut-waters. This large area was excavated by sinking four caissons, each 28 feet square, on the north and south sides of each pier, with two triangular-shaped caissons at each cut-water. The twelve caissons of each pier were all spaced 2 feet 6 inches apart, and enclosed between them a rectangular space, 34 feet by 124½ feet, in the heart of the pier. This was not excavated until the permanent work forming the outer portion of the pier had been built continuously within the

caissons and in the narrow spaces between them up to the level of a few feet above high-water. This method was cheaper and was attended with less risk than that of using larger caissons extending across the pier.

The caissons consisted of a single skin of wrought-iron varying in thickness from ½ inch at the bottom to ¼ inch at the top. The skin was supported every 3 or 4 feet in height by pitch-pine frames, with diagonals of the same material across. The joints of the removable portions were made watertight with indiarubber. The bottom section of each caisson was erected on a temporary platform fixed a short distance above low-water. Two pairs of trussed-beams were placed above the caisson, with their ends supported upon the staging on either side, and four 2½-inch rods passed between the beams, and were connected to the caisson near each corner. The rods were screwed at the top for several feet, and, by setting up the screws, the caisson was slightly lifted, whilst the platform was cleared away from beneath. The caisson was then lowered down on to the bed of the river and the excavation was commenced. Divers and grab-machinery were employed at first; but, as the ground consisted of the London clay, it was only necessary to sink the caissons some few feet beneath the river-bed, when the water could be pumped out of them, and the excavation continued in the dry.

The reliable nature of the clay rendered it possible to undercut beneath and beyond the bottoms of the caissons, whereby a considerable saving was effected in contracting the limits of the caissons within the outside line of the foundations. The undercutting was timbered with 1½-inch poling-boards, strutted back with timber props against the bottom of the foundations. By executing the undercutting in sections and quickly filling in the concrete as soon as the excavation of each section was completed, the danger that was liable to arise from any serious swelling of the clay was much diminished. After two adjoining caissons had been sunk and partially filled with concrete, the space between them was enclosed by driving piles in grooves specially provided at the corners of the caissons. This allowed the adjoining sides to be removed and the intervening space to be excavated and concreted up, thus converting the two caissons into one. By repeating the process a continuous caisson surrounding the heart of the pier was obtained. Within this the outer portion of the pier was built to a height of 4 feet above Trinity high-water, thus forming a cofferdam to exclude the tide from the inner portion of the work. When the latter had been pumped out and excavated the inner

sides of the caissons were taken out and the heart of the pier was filled in. The whole work was bonded together by numerous dovetails in the concrete and by toothings and rackings in the brickwork.

The materials in the two piers, from foundation-line up to a level of 4 feet above Trinity high-water (a height of 60 feet), consisted of 25,220 cubic yards of cement concrete, 22,400 cubic yards of brickwork in cement and 3,340 cubic yards of Cornish granite, making a total of 50,960 cubic yards. The cost of the same, including all subsidiary items, such as stagings, caissons and excavations, amounted to 111,122*l.*, so that the average cost of the construction was 2*l.* 3*s.* 7*d.* per cubic yard.

THE TOWER BRIDGE.

THE Lord Mayor presided at the last of the present series of lectures arranged by the Carpenters' Company on matters connected with building, when Mr. J. Wolfe Barry, C.E., delivered a lecture on the Tower Bridge. The Chairman, in briefly introducing the lecturer, congratulated him on having solved a difficulty which had been looked on as insuperable by his great predecessor, Brunel. Before proceeding to describe the present bridge, the lecturer touched shortly on the various bridges which exist or have existed in London, dealing with the necessity for their erection and the suggestions which had at various times been made to meet the want. He traced the history of London Bridge from about the year 1000 to 1758, when the last was seen of the old bridge with its curious buildings, and spoke of the various suggestions made for connecting the northern and southern banks of the Thames below London Bridge, when the necessity for such an arrangement became pressing. He then traced the history of the present bridge, a Bill to erect which was promoted by the defunct Metropolitan Board of Works without success, the Bridge House Committee taking the matter in hand in 1885, and bringing it to a successful conclusion. There were however difficulties, the chief of which was the insertion of a clause in the Bill which insisted on the maintenance during construction of a central waterway of 160 feet, thus necessitating the removal of a portion of the works of one pier before the other could be taken in hand, a fact which will explain some of the delay in the completion of the bridge. After an interesting account of the construction and sinking of the caissons within which the foundations of the

central piers were laid 102 feet below high-water mark, the lecturer described the remarkable works within those immense structures. Each of the leaves of the movable central bridge weighs, he stated, with its counter-balance, 1,045 tons, and moves on a pivot of steel 48 feet long and weighing 25 tons. The counter-balance moves in a large chamber, quadrant shaped, within the pier, within which is also contained the powerful actuating hydraulic machinery worked from the water towers at each end, by which the enormous leaves can be raised or lowered in one minute and a half. These leaves are to be fitted with lights for the information of approaching ships at night—four red lights signifying that the bridge is closed and four green lights that it is open. The hydraulic machinery, which was, he stated, the most powerful in the world, also works the lifts to the foot-bridge, 140 feet above high-water mark, for use when the main bridge is open. He stated the gratifying fact that the loss of human life during the seven years since the laying of the foundation stone had been less than might have been anticipated, six lives only having been lost. In conclusion, he ventured to predict that after the lapse of a time which he did not attempt to estimate, as the water traffic declined—as it naturally would do—and the land traffic augmented, the central span of the bridge would cease to be utilised as a movable structure. He paid a well-deserved compliment to his colleagues in the great work, which he said would cost considerably over a million, and hopefully anticipated that it would be complete and open for traffic before the conclusion of the present year. A vote of thanks to the lecturer closed the proceedings.

THE REBUILDING OF GLASGOW BRIDGE.

THE initial steps are now being taken with a view to the erection across the Clyde at the Broomielaw of the new bridge which has been so long in contemplation. The present structure, which will shortly be demolished, says the *Glasgow Herald*, was built of granite at the beginning of the century from plans prepared by Telford, the celebrated architect and engineer. It has served its purpose well, and its end has been decreed owing to the growth of the trade of the city, the consequent increase of cross-river traffic, and the alterations in the levels of the bed of the river resulting from the development of the harbour. Many schemes were proposed with the view of improving the old bridge. It was thus suggested that

the structure should be strengthened by the foundations being underbuilt, and that the roadway might be widened. These proposals, however, have not been acted upon, and the Corporation some time ago resolved to erect an entirely new bridge. Plans for this purpose have been prepared by Messrs. Cunningham, Blyth & Westland, C.E., Edinburgh, and have received the approval of the Town Council and the Clyde Trust. The work of erection has been entrusted to Messrs. Morrison & Mason, Glasgow, the well-known contractors. As it was impossible to divert the enormous amount of traffic which crosses the Clyde at this point, it has been found necessary to build a temporary service bridge for use during the erection of the permanent structure. Messrs. Morrison & Mason, acting under the direction of the engineers, began the work of erecting the temporary bridge about the middle of December. Considerable progress has already been made, and it is expected that the works will be completed by the end of July, when the removal of Telford's masterpiece will be proceeded with. The temporary bridge is being built of wood and steel, with a roadway 60 feet wide, the same width as that at present available for traffic. It will consist of seven piers, each composed of thirty timber piles driven into the bed of the river in rows of thirteen. These piles will be firmly braced together by joists, wales, runners and diagonals. On the top of the piers will be placed timber girder-bearers carrying thirteen steel-plate girders. The principle adopted in the construction of the bridge is the cantilever system, similar, though of course on a much smaller scale, to that applied in the building of the Forth Bridge. Perhaps it would be more correct to put it that the staging for driving the piles is on the cantilever principle, that is to say, the steel girders are projected from a pier, and on the top of these girders are placed the contractors' cranes for driving the pier in advance, so that no temporary staging in the river is required. This plan, which is being used for the first time in connection with pile-driving, obviates the necessity of obstructing the progress of the Clutha and the other harbour traffic. The piling machine is placed at the end of the jib of the crane and is held in position by means of guys and spars, and it drives the piles into proper position. Of the seven piers four are already nearly finished. In order to suit the different waterways of the existing and the new bridge two of the piers will not be parallel up and down the river, one of them being wider at the west end and the other at the east. The wooden runners are bolted on to the top of the steelplate girders, and on the runners

are nailed two thicknesses of 3-inch planking, which are placed at an angle in order to strengthen the bridge. Over the planking, which is perfectly close, there will be a layer of asphalt, and then the causeway-stones and tramway rails are laid on a thin layer of sand, so that the bridge, though only a temporary structure, will have the appearance of being more substantial than it really is. The parapets will be made of timber. To avoid inconvenience to traffic, which it is anticipated would ensue by the public watching the operations when the permanent bridge is in course of construction, the parapets will be made high, forming an impervious screen. The greater part of the traffic, it is expected, will be on the west side, and to cope with this the footpath will be made half as wide again as on the east side—the breadths being respectively 12 and 8 feet. While the permanent bridge is being erected and the waterway blocked at the north side, the waterway at the south span will be dredged at the temporary bridge, in order that the river traffic may be allowed to pass. The operations will cause very little inconvenience to the tramways. On leaving Jamaica Street, the track will curve round to the east and run along Great Clyde Street, and after crossing the bridge they will enter Bridge Street from Carlton Place. The temporary bridge is to cost about 14,000*l*.

THE AMERICAN UNIFORM CONTRACT SCHEME.

THE following report on the efforts to secure uniformity of contract in America was presented by the secretary at the St. Louis Convention of Builders:—

The valuable work of the National Association, the "Uniform Contract," has lately received an unusual amount of attention in several directions. It has been noticeable that for some reason or other, probably because of the continued agitation of the subject from this department, assisted by the efforts of individual members of the local bodies, a new and widely scattered demand for the document has developed, not in large quantities but for single copies as specimens and from all parts of the country, particularly in places not within the affiliation of the National, even as far away as Salt Lake City in Utah. Interest in this form manifests itself also in renewed criticism, which is most welcome, for such examination denotes a consideration of the method proposed, which in itself acts as an advertisement, and if intelligently applied will be productive of a clearer apprehension of its purpose and larger

use. There has, however, been one attempt to supplant or at least weaken the authority of the form, which calls for special comment, inasmuch as it emanated from a constituent body of the American Institute of Architects, the association which has joined with us in preparing and recommending this document for general use.

The Boston Society of Architects, ignoring the fact that it is a chapter of the American Institute, and also that at the annual convention of that body held in Boston in the fall of 1891, in which it participated, the acts of the joint committee on uniform contract were approved and the committee continued, proceeded, very soon after the said convention, to prepare, in consultation with legal advisers, a close but most inconsequent criticism of the standard form, distributing the same with a certain "suggestive form of contract" to its members, advising them to still follow their individual preferences in the matter of contract forms, rather than use the form regularly and properly approved by the National Association representing their profession. Now there can be no possible objection to fair criticism of the "uniform contract," but in this case the criticism was not properly applied and an effort was illegitimately made, the result of which if successful would be productive of the very evil which the bodies who framed the standard form aimed to eradicate or prevent, namely, diversity of forms of building contracts. The National Association of Builders has a right to expect from all its constituent bodies, loyalty to the method which it has united in establishing to produce equity and uniformity in this, one of the most important relations which the builder is called upon to assume in carrying on the business of building; and the National Association of Builders has also a right to expect loyalty on the part of constituent bodies of that National Association of Architects with whom it has joined in this important work. If constituent bodies of either of these national associations desire to suggest amendments or changes in the standard form there is a proper way to do it, and but one proper way, and that is by referring their suggestions to the joint standing committee on uniform contract. No constituent body of either party has the right to undermine the great work undertaken, by independently proceeding to supplant the form with some other or by advising its members to ignore altogether the uniform contract and continue on perpetrating diversity and confusion in contract forms.

The American Institute of Architects and the National Association of Builders five years ago deliberately adopted

the principle that in framing forms of building contracts the builder and the architect had equal rights; they still further recognised the importance and value of uniformity; and proceeding upon these lines prepared, issued and recommended the "uniform contract." So long as any local body maintains its affiliation with its central body it should so proceed and should so order its actions as not to handicap or render nugatory the efforts which are instituted by the central body. It may not, it is true, always fully approve of the methods which the central body may adopt, but it is bound at least not to take active measures in opposition thereto except in proper and legitimate ways. The Boston Society of Architects has in this matter ignored the principles which its national body has regularly and fully recognised and adopted, namely, that the builder has equal rights in framing the forms of contract he is to be a party to, and has proceeded as an independent body to do what it can to overthrow that principle as well as prejudice, and embarrass the purposes not only of the body of which it is a chapter, but also of that body with which the American Institute has united for this specific purpose and to which it is in honour bound.

It is unpleasant to note that although the attention of the Boston Society was courteously called to the conditions and obligations existing between the two national bodies, it, with considerable asperity, repelled the right of any one to criticise its acts, although it at the same time maintained its entire freedom to criticise the acts of others. This will be recognised as a familiar attitude on the part of architects as a class. I have given considerable space to this particular manifestation, for it seems to me to involve a principle which ought not to be lost sight of, and demonstrates that there is a failure among architects as a class to comprehend the purpose underlying the establishment of the "uniform contract," and also shows lack of recognition among them of their amenity to anything except their individual desires.

Builders will gradually learn by such examples as this that in the matter of their rights as to forms of contract which they are to sign, as well as in other directions, it is only by united and persistent endeavour that proper relations can be secured and maintained. You may never hope for some one else to be considerate enough to deal justly by you, you must rely upon yourselves for every advance out of the slough into which you have fallen.

In pleasant contrast to the condition of things above described was the meeting of the joint committee on uniform

contract, to consider for the first time since its establishment a revision of the standard form.

The report of your delegates to that committee will give you in concise form the result of that meeting, in connection with the views of the committee in relation to more universal use of the document. I can only supplement their report by saying that the meeting, in which I participated in an advisory capacity as well as scribe, was most harmonious, and it was particularly gratifying to note that many of the points, the importance of which your original committee found very hard to impress upon the architects who first sat in council with them five years ago, are now considered by the architects themselves as most essential features. I feel assured that the simplification of the form which resulted from this meeting will aid very much in its increased use. The shortening by some five or six hundred words will in itself prove a great card in its favour, for it is now without exception the shortest building contract in general use. I note in the Underwriters' National Convention that our contract was very favourably mentioned. The insurance men have, to use a common phrase, "caught on," to the advantage of uniformity in matters of insurance.

I beg to suggest that the committee in their report cannot too emphatically urge all members of filial bodies to insist for their own protection on the use of this form whenever they are called upon to sign a contract, and further urge all filial bodies to keep a supply on hand, and periodically send out specimen copies to all architects, as well as to their own members, to keep the form in mind as a live issue. Once sending is not enough; people are forgetful, and one of the functions of the local body is to keep those with whom it comes in contact reminded of the things that are done and are being done for their benefit. Printed slips should accompany each specimen copy, with publisher's address, prices and other information.

The report of committee ran as follows:—

For five years the "uniform contract" adopted in 1888 by the joint committee of the American Institute of Architects and the National Association of Builders has been before the public.

The fundamental principles therein expressed have been tested and approved by time, but while the instrument has added to the number of its friends among architects from year to year, and owners have acknowledged its evenhanded fairness to both parties and executed it readily, there still are many architects who do not use this form of contract.

A large number of those who still cling to old forms are

doubtless those whose conservatism impels them to doubt new though better methods, while others have failed to employ the standard form for the reason, which they frankly admit, that the older forms give to them and to their clients the owners a greater advantage over the builders. This is an entirely improper position, for a contract of this nature should in no way give more advantage to one than to the other party to it, and it has been the purpose from the first to provide in the uniform contract an instrument which should give evenhanded justice to all concerned in it.

It is very evident that many architects will not voluntarily adopt this form, either because of their conservatism, or from unwillingness to give up an unfair advantage, or from ignorance of the terms of the document, and it is therefore important that the builders themselves should decline to sign other forms.

The more general use of the uniform contract may be said to depend to a very great extent upon the insistence of builders that this form and no other is acceptable to them. This attitude is strongly urged by your committee.

During the last year meetings of the joint committee have been held, and we now present to you a revised form which, in our judgment, covers the same ground in more direct language, and adapts it better for use of sub-contractors for their particular portions of a building.

No changes were made without careful consideration and full discussion, and without entering here upon a discussion of the merit of each change, we express the belief that experience will endorse our action. In this action your committee has gone to the length of its authority.

The uniform contract is "adopted and recommended for general use by the American Institute of Architects and the National Association of Builders." Upon your individual effort depends its general use.

UTILISATION OF WATER-POWER.

OWING to the perfection which is attained by novel forms of hydraulic machinery, electric water-power has assumed unexpected importance, and its utilisation has become attractive. A paper which was read at the last meeting of the Royal Scottish Society of Arts, by Mr. John Ritchie, indicates that in the North the opportunities of turning water to account will not be neglected. The author said that in this country we

**A Splendid Example of Colour-Work in Permanent Ink Photo,
BY M. PAUL ALBERT BAUDOIN.**

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*.
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

were much behind people on the Continent and the United States in using water as a source of power. He described some of the hydraulic works in Switzerland, Austria and America, and gave a detailed account of the present gigantic scheme for utilising the waters of Niagara. Reference was also made to similar works in course of construction in India having for their object the utilisation of the water stored for irrigation purposes. In Scotland a large increase in the use of water-power took place between the years 1825 and 1840, and works had been erected at Deanston on the Teith, Stanley on the Tay, Katrine on the Ayr, and Shaws Waterworks at Greenock. The rainfall was the natural origin of all running streams. In England the average fall might be taken at 32 inches; in Scotland it was 36 inches; and in Ireland it was set down at 36 inches. The great drawback to the use of water as a power was owing to the difference between the winter and summer supply, involving the use of steam-engines to supply power in dry weather, and in this connection the question of storage arose. Figures were given to prove that there was abundance of water for every purpose, and the question came to be, Would the construction of reservoirs give an adequate return for the outlay? In his opinion it would. They must look to the future development of some efficient means of storage at high levels and the more extended use of high-pressure turbines. Many Scottish lochs by their configuration lent themselves to an easy adaptation for storage purposes, and land was of little value in such districts. There were four methods by which power could be transmitted to existing centres—first, by wire rope; second, by hydraulic pressure; third, by compressed air; and fourth, by electricity. And an examination of those showed that the only means of transmitting power economically for long distances was by electricity. Mr. Ritchie stated in conclusion that the subject was so large that he proposed to give a further paper on the means of utilising power at a future meeting.

SEWERAGE SYSTEMS AS MUNICIPAL INVESTMENTS.

THE New York *Engineering Record* says:—Some interesting figures, compiled by assistant city engineer Snyder, concerning the actual cost of the Dallas, Tex., sewerage system, have recently reached this office, and are given in abstract below. This system was begun in 1883 under the direction of the city engineer, and all engineering work on the design and construc-

tion has been within his department. Hence the actual capital investment is easily determined, being the amount expended in construction, maintenance and interest on bonds up to date. The separate system is used and embraces 4,920 feet of 36-inch brick sewer at 5·13 dols., 6,926 feet of 24-inch pipe at 3·867 dols., 1,490 feet of 20-inch at 2·291 dols., 2,668 feet of 18-inch at 2·08 dols., 6,188 feet of 15-inch at 3·129 dols., 5,658 feet of 12-inch at 1·208 dols., 5,209 feet of 10-inch at 99 cents, 33,692 feet of 8-inch at 71 cents, and 69,654 feet of 6-inch at 46·2 cents, making a total of 25·8 miles at an average cost of about 1·09 dols. a foot. These prices include all the work incidental to sewerage construction distributed in the following ratio:—Pipe and brick in place, 41·1 per cent.; excavation and back filling, 40·7 per cent.; rock excavation, 10·1 per cent.; man-holes, 2·2 per cent.; lampholes, 0·4 per cent.; embankment, 1·5 per cent.; replacing pavement, 2·7 per cent.; incidentals, lumber, iron pipe, 1·3 per cent.

The cost of operation has been slight. One man has been employed regularly, whose duty is to keep the sewers clear of obstruction, and keep the flush-tanks in order, at an annual expense of 1,000 dols. plus a few incidental repairs. The sewerage bonds of the city bear interest at the rate of 5 per cent., making the annual interest on the total cost of the system, which is 148,270 dols., in round numbers 7,500 dols., or the total annual expense of the entire sewerage system, 8,500 dols. Bonds in excess of this for sewerage improvements have been issued, but the proceeds have been transferred to other accounts; no further sum is really chargeable to the annual expense of the sewerage system, according to the report of Mr. Snyder.

The records show that there were to January 1, 1893, 1,065 connections with the sewers, embracing the following number and kind of fixtures:—Slop-sinks, 967; water-closets, 2,072; urinals, 247; baths, 632; wash-basins, 347. The records of the waterworks office for the quarter ending December 31, 1892, show that the number of taps from which water rents were collected was as follows:—1,272 water-closets at 2 dols. 25 cents; 230 baths at 2 dols. 50 cents; 51 urinals at 3 dols.—total for three months, 3,390 dols., or 14,360 dols. for a year. Sinks and basins are seldom an extra charge for water service over and above the rate for the fixtures mentioned, so no possible income attachable to the sewers from them is taken into account. The average annual income from the above to the sewerage department, were drain-fixtures taxed as water taps are, would be about 14,360 dols., or nearly 10 per cent. of the

total cost. It is possibly a little in excess of this amount, as there are many more fixtures in use in the summer months than in the quarter under consideration. The additional cost of operation of a waterworks plant by reason of the increased consumption with a sewerage system in use is an inconsiderable amount, for the sewerage system being a subsequent growth upon the water system, the latter needs no extension of service, according to Mr. Snyder, beyond that for fire-protection, and the extra amount of water consumed is offset by the general cleanliness of the city.

As an investment wherein each class and kind of fixtures could be charged for sewer service in a ratio corresponding with the water service, the following number of fixtures would be chargeable as in use at the present time:—1,412 water-closets, 104 urinals, 276 baths, 710 sinks and 280 wash-basins. The rate of scavenger fees for removing the accumulated filth in cities without a sewerage system, Mr. Snyder reports as varying from 50 cents to one dollar, or even more, a month for dwellings with a small number of occupants. This increases the average possible charges, which could be apportioned in about the following manner:—Water-closets, 80 cents a month; urinals, 25 cents; baths, 20 cents; sinks, 40 cents; basins, 10 cents. These prices Mr. Snyder assumes as the average for a city. For small dwellings they would fall lower, and for single fixtures much used they would rise above the average, each group of fixtures having a rate corresponding to the amount of use. The fixtures in use for the last quarter of 1892 would net an income of 1,528 dollars 80 cents on an annual income of 18,274 dollars, about 12½ per cent. on the money invested.

THE SEVERN BRIDGE AT STOURPORT.

THE toll for crossing the Severn Bridge at Stourport has now been abolished. Stourport, says the *Birmingham Post*, is a town which sprang into existence in the latter part of the last century, entirely through the facilities given to it for water traffic when the Staffordshire and Worcestershire canal was carried to a junction with the Severn at what is now known as Stourport. Bewdley had opposed the construction of a canal to the Severn at Bewdley, and thought to maintain its monopoly of the then great traffic by means of pack-horses and barges to and from that then busy emporium for the goods, which were exchanged from boat to pack-horse or pack-horse

to boat. As many as four hundred pack-horses were at that period sometimes stationed on a single night at Bewdley and Wribbenhall. When the waywardness of Bewdley turned away canal engineers and promoters, the opportunity of Stourport came. The Staffordshire and Worcestershire Canal, as before stated, was constructed, and what was practically as much a waste as the existing reaches of Hartlebury Common became a busy and growing settlement. With the construction of the canal, and the continuous growth of population at Stourport, came the question of spanning the Severn with a bridge, and an Act of Parliament was obtained for the purpose.

In these days of ship canals, however, and Severn improvement schemes, it may not be out of place to state that so long ago as 1784 Mr. William Jessop, an engineer of that time, proposed to convert the Severn into a ship canal as far as Stourport, and the plans and report connected with his scheme are, we understand, still extant. The riparian landowners were hostile to Mr. Jessop's project, and, like many other men, he proved to be before his time, and a long period elapsed before the improvement of the navigation of the Severn again came up. Returning to the subject of the bridge thrown open on Monday, we may state that it was erected by Messrs. Wilton & Co., of Birmingham, under the superintendence of Mr. T. Vale, from the plans of Mr. Edward Wilson, C.E., of Westminster. It cost between 9,000*l.* and 10,000*l.*, and is a bold feature in the scenery of the river.

Mr. B. Danks said they were met that day to perform a ceremony in which the inhabitants of Stourport, Areley Kings and the public generally were deeply interested, viz. to transfer that bridge to the County Council of Worcester as a free bridge. He thought it might not be out of place if, before the trust was dissolved, he gave them a short account of what the trustees of Stourport Bridge had done. In the year 1768 the only way of crossing the Severn for all traffic near there was by the ford at Redstone, or by a ferry-boat kept there, the approach from Stourport side being across Hartlebury Common and down the Watery Lane. This ferry was private property. The Staffordshire and Worcestershire Canal Company about this time made their canal to join the river Severn, and Stourport was rising into importance, although there were at the time only a few houses, and the land now covered with buildings, streets, &c., was then occupied for agricultural purposes. It was thought desirable to erect a bridge over the river, and, as showing the great interest this scheme created, Mr. Danks stated that no fewer than 209 of the leading people in the neighbourhood and

in the county, amongst which were to be found many family names, applied to Parliament in the reign of George III. for an Act to constitute a body of trustees to build a bridge and make approaches thereto, to raise money on mortgage on security of the tolls, and to purchase the ferry. The trustees had power to levy much higher tolls than they had charged of late years, and one clause was that the bridge was never to become a county bridge. The Act was obtained in 1768, and a bridge consisting of three arches of stone and brick was erected, and about forty-four land arches and one mile of road formed the approaches. This bridge only lasted twenty-seven years, and the tolls taken had not paid the interest on the mortgage debt when, in 1795, a great flood washed away two of the arches, and damaged the third. In this dilemma the trustees again applied to Parliament for a second Act to raise more money and build a new bridge over the river. Profiting by the mishap to the first bridge, the trustees decided to erect a single arch or span over the water, of iron, and it was an early application of iron to bridge building. Iron plates formed the roadway, which was carried by oak uprights and beams from the iron arch. Many present-to-day would recollect that bridge. It became very costly to keep in repair, and, after lasting seventy-three years, was thought not to be in a satisfactory condition, the gradients to the top being very steep, and the bridge narrow. In 1868 the trustees decided to remove the arch crossing the river, and to erect a modern all-iron bridge of easier gradient, and to widen both bridge approaches. A third Act of Parliament had to be obtained to do this, and the result was the substantial and handsome structure they were then upon. It had been in use about twenty-five years, and he thought was in as good condition now as when erected. The trustees had, by their management, reduced the debt on the bridge to a comparatively small amount, and two years ago negotiations were entered into between the trustees and the County Council to make it a county bridge, but it was found that an Act of Parliament was necessary to enable the trustees to transfer the bridge to the County Council, and to enable the County Council to accept the transfer. This was the fourth Act of Parliament obtained by the trustees, but this time it was not to build another bridge, but to enable the trustees to part with the bridge and dissolve the trust. This Act received the Royal assent on May 20, 1892, and it was to carry out and complete the intention of that Act that they were assembled there that day. No doubt the most interesting part to them all was that in future it was to be a free bridge.

BIRMINGHAM BUILDING TRADES

THE protracted strike which took place in the Birmingham building trade in the spring of last year was, the *Birmingham Post* says, the occasion of a large amount of public inconvenience, and must also have entailed considerable pecuniary loss both upon the employers, whose contracts were at a standstill, and upon the bricklayers and labourers, who only secured their advance of wages at a cost which they must have felt very severely. The motive which animated the employers in resisting the demand which was then made was doubtless a feeling that if they conceded the extra halfpenny per hour to the bricklayers and labourers, this would be followed by a claim for an increase on the part of other branches of labour connected with the building industry, and the masters were of opinion that the state of trade would not justify an advance. Nor were they far wrong in their prognostication of further demands, for when the month of October came the carpenters and plasterers gave the six months' notice prescribed by the rules of the trade, that on and after April 1 this year they would expect an increase of a halfpenny an hour, while the stone-masons gave notice for an alteration of working hours. The masters met this with a notice to the bricklayers and labourers to discontinue the extra halfpenny they had gained, and it seemed only too probable that we should have last year's contest repeated this spring upon an extended scale. Happily, as events have proved, the master builders had learnt from their experience the advantage of conciliation, and have now shown that they were willing, provided the operatives would meet them upon some minor points, to concede a continuation for another twelve months of the wages increase that had been won by the men in the last strike, and its extension to the plasterers. Numerous meetings have been held lately, at which the exercise of a friendly spirit has smoothed away difficulties. The remaining difficulty, which principally affected the case of the carpenters, was referred to an arbitration, in which, although his honour Judge Chalmers was in reserve as umpire, it was found possible to come to a settlement without imposing upon that gentleman's much-occupied time and attention. An extra halfpenny per hour was conceded to the carpenters, and an agreement has been signed with respect to questions of hours, of overtime, supervision of work and other matters of internal trade interest. We congratulate those engaged in the trade—both masters and men—upon this result, and trust that the harmonious relations now re-established may long continue between them.

It will be remembered that the bricklayers, the labourers and the plasterers had differences with their employers, all of which were settled. There remained still a dispute in which the carpenters and joiners were concerned, and this was referred to the arbitration of Mr. Redfern (of the firm of Horton & Redfern, solicitors), acting on behalf of the masters, and Mr. A. R. Jephcott representing the men. The arbitrators agreed that Judge Chalmers should be the umpire in case of any disagreement between them; but, fortunately, no point has arisen on which full but conciliatory discussion has not been found sufficient to bring about an agreement, and yesterday the award was signed. The principal question in dispute was that of the increase of $\frac{1}{2}$ d. per hour asked for by the men. This practically had been conceded by the masters, and the arbitrators have granted it in their award. On a number of minor points, such as the time for ceasing work on Saturdays, payment for overtime, the supervision of carpenters' work, &c., the arbitrators have arrived at a settlement. The decisions of the arbitrators are embodied in a set of new rules, which will be binding on masters and men until April 1, 1894. If either party should desire a revision at the expiration of the twelve months, notice must be given before November 1 next, otherwise the rules will continue in force from year to year, subject to six months' notice for revision, to be given before November 1 in any year.

THE REQUIREMENTS OF THE EDUCATION DEPARTMENT.

THE following are the latest amended rules of the Education Department in respect to the planning of schools:—

School boards and school promoters are requested to note that the Education Department require the following plans, and that inattention to such requirement entails delay.

I. A block plan of the site, drawn to a scale of 20 feet to an inch. This plan must indicate—(a) The position of the school buildings; (b) outbuildings; (c) playgrounds; (d) drains (collateral and main), with their fall and depth below ground; (e) entrances; (f) boundary walls or fences and their nature; (g) roads; (h) the points of the compass; (i) the levels of the ground at the principal points.

II. A plan of each floor of the schoolrooms (and teacher's or caretaker's residence, if any) drawn to a scale of 8 feet to an inch. The internal fittings of the rooms (fireplaces, groups

of desks, benches, &c.) must be accurately shown. The plan should also state whether the rooms are intended for boys, girls or infants. In cases of enlargement a plan showing the buildings as they exist is needed.

III. Sections and at least four elevations, also drawn to a scale of 8 feet to an inch. The ceiling, the positions of window-heads in relation thereto, and the mode of ventilation must be shown.

N.B.—(a) Pencil drawings cannot be received, but coloured tracings in ink may be submitted while plans are in the preliminary stage of pencil, so that suggested alterations can be adopted without difficulty or expense; (b) tracings should be on cloth; (c) in the case of enlargements the whole site and the existing building should be accurately shown; (d) all plans should be dated, the scales drawn on, and dimensions figured.

IV. A detailed specification separated under the several branches of the building trade.

BUILDING RULES.

1. Planning and Accommodation.

I. In planning a school the first thing is to seat the children in the best manner for being taught. The accommodation of each room depends not merely on its area, but also on its shape (especially in relation to the kind of desk proposed), the positions of the doors and fireplaces and its proper lighting. The second point is to group the rooms together in a compact and convenient manner.

2 and 3. Schoolrooms.

2. Every school must have a schoolroom as hereunder, or a central hall as under rule 8. The proper width for a schoolroom is 18 to 20 feet for long desks, or 22 feet for dual desks. If the width does not exceed 20 feet, groups of long desks, three or four in number, according to the width, must be used; if the width is 22 feet dual desks, five rows deep, must be used. (For classrooms see rule 7.)

(a) Accommodation in schoolrooms for elder children is calculated by the number of children seated at desks and benches, subject to a minimum of 10 square feet per child being provided. For the mode of calculating accommodation in classrooms see rule 7, in infant schools see rule 16.

(b) Double-bank schools (now almost obsolete) require rooms 32 feet wide, walls left clear for three rows of desks and ample lighting from windows on both sides extending to ceiling.

SHORLAND'S PATENT COMBINATION OPEN FIRE-PLACE MANCHESTER STOVE

Made in various Designs and Sizes, with Tiled or Iron Sides, Single or Double Fronted, and with Ascending or Descending Smoke Flue.

Very largely used in HOSPITAL WARDS, for which the down-draught arrangement, as now shown, is specially suited.

WORKS, ROTHERHAM. Estab. 1854.

(c) Wasted space cannot be considered.

3. The doors and fireplaces in schoolrooms must be so placed as to allow of the whole of one side of the schoolroom being left free for the groups of benches and desks.

(a) No schoolroom lighted from one side only can be approved. The gable-ends should be fully utilised for light. (See also rules 9 and 9 (b).)

4. Walls, Floors and Roofs.

4. The walls of every schoolroom and classroom, if ceiled at the level of the wall-plate, must be at least 12 feet high from the level of the floor to the ceiling; and if the area contain more than 360 superficial square feet, 13 feet, and if more than 600, then 14 feet.

(a) The walls of every schoolroom and classroom, if ceiled to the rafters and collar beam, must be at least 11 feet high from the floor to the wall-plate, and at least 14 feet to the ceiling across the collar beam.

(b) Great care should be taken to render the roofs impervious to cold and heat.

(c) Roofs open to the apex are not approved. They can only be permitted where the roofs are specially impervious to heat and cold, and where apex-ventilation is provided. Iron tie-rods are least unsightly when placed horizontally.

(d) The whole of the external walls of the school and residence must be solid. If of brick, the thickness must be at least one brick and a half; and if of stone, at least 20 inches.

(e) All walls, not excepting fence walls, must have a damp-proof course just above the ground line.

(f) The whole area of the building should have concrete 6 inches thick under the ground floor, and air bricks for ventilation to joists.

(g) Timber should be protected from mortar and cement by asphalt or tar.

5. Entrances.

5. Entrances should be separate for each department. In large schools more than one entrance is desirable. The principal entrances should never be through the cloak-room. Entrance doors should open outwards. A porch should be external to the schoolroom.

6. Cloak-rooms.

6. Cloak-rooms must be external to schoolrooms and classrooms, with gangways at least 4 feet wide, amply lighted from

the end. Hat-pegs should be 12 inches apart, numbered, and of two tiers. The hanging-space should be 6 inches lineal per child, so as to provide a separate peg for each.

7. Classrooms.

7. Classrooms are calculated at 10 square feet, if not providing accommodation for more than sixty children. Six rows of dual desks or four rows of long-length desks are permissible in such classrooms. Rule 2 applies to all rooms providing accommodation for more than sixty, or being more than 24 feet 8 inches deep from the window wall.

(a) The minimum size of classroom is 18 feet by 15 feet. If desks are placed longitudinally, the width should not be less than 16 feet. This latter width is also allowed in schoolrooms of very small size.

(b) The classrooms should never be passage-rooms from one part of the building to another, nor from the schoolrooms to the playground or yard, and should be on the same level as the schoolroom. Each should be easily cleared without disturbance to any other room.

(c) The number of classrooms should, where practicable, equal the number of classes in the schoolroom.

(d) The excessive use of movable partitions should be avoided.

8. Halls.

8. Large schools are sometimes planned with a central hall, which is not calculated in the accommodation.

In the case of mixed schools an exception is made, one class being necessary in the hall in order to secure a teacher's supervision of the separate exits to the latrines (see rule 13 (a)); the hall must, therefore, be suitable for teaching such class; it must be fully lighted, warmed and ventilated, and must contain a floor space of not less than 1,200 square feet, and the fittings must be marked on the plan.

9. Windows.

9. The light should, as far as possible, and especially in classrooms, be admitted from the left side of the scholars. [This rule will be found greatly to influence the planning.] All other windows in classrooms should be regarded as supplementary, or for summer ventilation. In cases where left light is impossible, right light is next best. Windows full in the eyes of teachers or scholars are not approved. In rooms 14 feet high any space beyond 24 feet from the window wall is insufficiently lighted.

THE "INFANT" DYNAMO.
ARCHITECTS are invited to SPECIFY it for small Electric Lighting Plants.

ADVANTAGES.—The Framework is cast in one solid piece. The Armature can be taken out in a few seconds. There are no loose wires dangling from the brush-holders. The "Infant" Dynamo attains the high efficiency of 92 per cent. Full particulars and prices on application.
H. AUSTIN, Florence Works, Armley, LEEDS.

(a) Windows should never be provided for the sake merely of external effect. All kinds of glazing which diminish the light and are troublesome to keep clean and in repair should be avoided. A large portion of each window should be made to open for ventilation and for cleaning.

(b) The sills of the main lighting windows should be placed about 4 feet above the floor, and the tops of some should always reach nearly to the ceiling. The ordinary rules respecting hospitals should here be remembered.

(c) Skylights are objectionable, and should never be resorted to where windows are possible. Plans needlessly involving their use cannot be approved, except in the case of central halls having ridge or apex ventilation.

10. Staircases.

10. A staircase, like a porch, must be external to the school-room. No triangular steps or "winders" should be used. Each step should be about 13 inches broad, and not more than 6 inches high. The flights should be short, and the landings unbroken by steps. The number of staircases should be sufficient, not only for daily use, but for rapid exit in case of fire or panic.

11. Ventilation.

11. Apart from open windows and doors, there should be provision for copious inlet of fresh air, also for outlet of foul air at the highest point of the room. The best way of providing the latter is to build to each room a separate air chimney, carried up in the same stack with smoke flues. An outlet should be warmed in some manner, or it will frequently act as a cold inlet. The principal point in all ventilation is to prevent stagnant air. Particular expedients are only subsidiary to this main direction.

(a) Although lighting from the left hand is considered so important, ventilation in summer demands also the provision of a small swing window as far from the lighting as possible, and near the ceiling.

12. Warming.

12. The warming should be moderate and evenly distributed so as to maintain a temperature of from 56 deg. to 60 deg. When a corridor or lobby is warmed, the rooms are more easily dealt with, and are less liable to cold draughts. Where schools are wholly warmed by hot water, the principle of direct radiation is recommended. In such cases open grates in addition are useful for extra warming occasionally, and their flues for ventilation always.

(a) A common stove, with a pipe through the wall or roof, can under no circumstances be allowed. Stoves are only approved, when

(i) Provided with proper chimneys (as in the case of open fires);

(ii) Of such a pattern that they cannot become red-hot, or otherwise contaminate the air;

(iii) Supplied with fresh air, direct from the outside, by a flue of not less than 72 inches superficial, and

(iv) Not of such size or shape as to interfere with the floor space necessary for teaching purposes.

(b) A thermometer should always be kept hung up in a school.

13. Sanitary Arrangements.

13. Waterclosets within the main school building are not desirable, and are only sanctioned for female teachers. All others should be at a short distance and completely disconnected from the school.

(a) The doors, staircases and passages leading from the school-room to the latrines (whether in mixed or in other schools), and the latrines themselves, must be separate for the two sexes, and constructed entirely apart from each other. In the case of a mixed school this rule especially affects the planning.

(b) Each closet must be separate, having a door and ventilation to each. More than one seat is not allowed in any closet. A good light should be provided.

(c) The children must not be obliged to pass in front of the teacher's residence in order to reach their latrines.

(d) The following table shows approximately the number of closets needed:—

	For Girls.	For Boys.
Under 50 children	3	2
" 70 "	4	2
" 100 "	5	3
" 150 "	6	3
" 200 "	7	4
" 300 "	8	5
Urinals in proportion		

(e) Cesspools and privies should only be used where unavoidable. Earth or ash closets of an approved type may

Capable of the most artistic treatment

be employed in rural districts, but drains for the disposal of slop and surface water are still necessary.

(f) Soil-drains must always be laid outside the building (on a hard even bottom of concrete) in straight lines with glazed stoneware pipes, carefully jointed in cement and made absolutely water-tight. A diameter of 4 inches is sufficient unless for drains receiving the discharge of more than ten closets. Above this number the diameter should be 6 inches. The fall should never be less than 1 in 30 for 4-inch, and 1 in 40 for 6-inch drains. An inspection opening or chamber should be provided at each change of direction so as to facilitate cleansing the drain without opening the ground. Every soil-drain must be disconnected from the main sewer by a properly constructed trap placed on the line of drain between the latrines and the public sewer. This trap must be thoroughly ventilated by at least two untrapped openings; one being the 4-inch soil pipe carried up full size above the roof and the other an inlet pipe connected with the side of the trap furthest from the public sewer. Automatic flushing tanks are desirable where trough closets are used.

(g) Urinals must in all cases have a sufficient supply of water for flushing.

(h) Waste pipes from sinks or lavatories should be first trapped inside and then made to discharge direct through the wall over a trapped gully.

14. Desks.

14. Benches and desks, graduated according to the ages of the children, should be provided for all the scholars and placed at right angles to the light. (See also rules 3 (a) and 9.)

An allowance of 18 inches per scholar at each desk and bench will suffice (except in the case of the dual desk), and the length of each group should therefore be some multiple of 18 inches with gangways of 18 inches between the groups and at the walls. In the case of the dual desk the usual length is 3 feet 4 inches and the gangways 1 foot 4 inches.

(a) The desk should be very slightly inclined. An angle of 15 deg. is sufficient. The objections to the inclined desk are that pencils, pens, &c., are constantly slipping from it, and that it cannot be conveniently used as a table. The objection to the flat desk is that it has a tendency to make the children stoop. A raised ledge in front of a desk interferes with the arm in writing.

(b) As a general rule, no benches and desks should be more

than 12 feet long. And no group of long desks, in a school-room providing for more than 60 children, should contain more than four rows of benches and desks (or three, if the width is less than 20 feet), because in proportion as the depth is increased, the teacher must raise his voice to a higher pitch; and this becomes exhausting to himself, while at the same time it adds inconveniently to the general noise.

15. Sites and Playgrounds.

15. Every school should have an open airy playground proportioned to the size and needs of the school. The minimum size of site is, in the absence of exceptional circumstances, a quarter of an acre for every 250 children. If the school is of more than one storey this area may be proportionally reduced. The minimum open space is 30 square feet per child.

(a) In the case of a mixed school, playgrounds must be separate for the boys and girls.

(b) All playgrounds should be properly levelled, drained, enclosed and fitted with some simple appliances. A portion should be covered, having one side against a wall. A covered-way should never connect the offices with the main building. Buttresses and corners should be avoided.

(c) An infant school should have its playground on the same level as the school.

16. Infant Schools.

16. Infants should not, except in very small schools, be taught in the same room with older children, as the noise and the training of the infants disturb and injuriously affect the discipline and instruction of the other children.

(a) There must be no opening wider than an ordinary doorway between an infants' and any other schoolroom because of the sound of the infant-teaching.

(b) An infant school and playground should always be on the ground-floor, and if more than eighty scholars are admitted should have one gallery and a small group of benches and desks for the occasional use of the elder infants.

(c) No infant gallery should hold more than eighty or ninety infants. It should be well lighted from one side. The light for object-lessons is as good from the right as from the left.

(d) The width of an infant schoolroom should be in proportion to its size, but not more than 24 feet.

(e) The babies' room should always have an open fire.

(f) The accommodation of an infant school is calculated at 8 square feet for each child, after deducting wasted or useless

Wrought-Iron Work. Stained Cathedral Glass, and any other Interior Work.

space, but a larger area should be allowed wherever practicable. Where a second standard is taken in an infant school the accommodation for it is calculated at 10 square feet per child.

17. *Cookery Centres and Classrooms.*

17. A cookery centre should be capable of accommodating at least one class of twenty-four at practice and not more than seventy-two at demonstration at one time. A cookery classroom should contain about 400 superficial feet and be approached by a separate entrance in the girls' playground. A small scullery is necessary.

18. *Workshops and Laundries.*

18. Workshops and laundries are best entirely apart from the school.

19. *Teacher's House, &c.*

19. The residence for the master or mistress should contain a parlour, a kitchen, a scullery and three bedrooms, and the smallest dimensions which their lordships can approve are—

For the parlour	12 ft. by 12 ft.	of	8 feet	in height to wall-plate.
„ the kitchen	12 ft. by 10 ft.	super-	8 feet	
„ one of the bedrooms	12 ft. by 10 ft.	ficial	8 feet	if ceiled at wall-plate; or
„ two other bedrooms	9 ft. by 8 ft.	area	7 feet	to wall-plate and 9 feet to ceiling.

(a) The residence must be so planned that the staircase is immediately accessible from an entrance-lobby and from the parlour, kitchen and each bedroom without making a passage of any room.

(b) Each bedroom must be on the upper storey, and must have a fireplace.

(c) The parlour must not open directly into the kitchen or scullery.

(d) There must be no internal communication between the residence and the school.

(e) There must be a separate and distinct yard, with offices.

(f) A caretaker's house need not be quite so large.

(g) All houses should be separate from and not built as part of the schoolhouse.

20 and 21. *Loans.*

20. No loan of money can be obtained from the Public Works Loan Commissioners unless the whole cost of the school, exclusive of site, legal expenses, extra rooms for instruction authorised by the code, and residences (if any), is kept within the sum of 10% per child accommodated. An allowance will also be made in reference to the cost of a

central hall not calculated in the accommodation (rule 8). Rooms for extra subjects recognised by the new code, such as drawing, chemistry, &c., will have an allowance varying from 15s. to 20s. per square foot. From 275% to 400% will be allowed for a caretaker's house. From 275% to 500% will be allowed for a cookery centre. Whether the necessary loan be borrowed in the open market or not, extravagant plans cannot be approved.

21. The Department do not entertain applications for loans when the expenditure has been incurred without their previous sanction.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

5888. Frank Edward Priest, for "Improvements in gullies."
 5910. John William Tegg, for "Improvements in window or sash fasteners."
 5914. Josiah Thomas Shaw, for "Improvements in the construction of sash weights."
 5975. Robert Robinson Cowl, for "A new or improved locking-gear for window sashes."

THE Architect and Contract Reporter.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.
All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

TRADE NOTES.

MESSRS. LAING, WHARTON & DOWN, of 82A New Bond Street, W., have just received the contracts for electrical installations, or other electrical work, at the following places:—The residence of Mr. S. Gross, 19 Queensborough Terrace; Nos. 1, 2 and 3 Egerton Place, for Mr. Mervyn Macartney; No. 6 Hyde Park Terrace, for Mr. Mervyn Macartney; the erection of fittings, &c., for Sir C. Euan Smith, 11 Draycott Place; the business premises of Mr. Pickett, 79 New Bond Street; the erection of fittings and alterations, for Mr. A. Blomfield, 25 Hereford Square; running new mains and making alterations at 32 George Street, Hanover Square; the residence of Mr. A. H. Robby, 3 Curzon Street.

MR. A. G. HAMILTON, of the "Quintin Matsys Forge," is continuing his business of ornamental and structural ironwork in connection with Messrs. Ritchie & Co., the patentees of the well-known "Lux-Calor" Stoves, at 83 Commercial Road, Waterloo Bridge, S.E.

A MANSION has just been erected near Douglas, Isle of Man, from the designs of Mr. H. B. Scott, 23 Athol Street, Douglas. A large quantity of Corsham Down stone, from the quarries of the Bath Stone Firms, has been used in the construction.

FOR the Clowm Sewerage Works the Worksop Rural Sanitary Authority have accepted the tender of 1,923½, sent in by Mr. John Bentley, of Leicester, for the construction of certain pipe-sewers and laying out sewage farm. The estimate of the

THE WELL-KNOWN FRIEZE,

ENTITLED

"THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo, BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Standard*.
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

engineer, Mr. W. H. Radford, for the works was 2,250*l.*, and an additional sum of 500*l.* was included for contingencies. The contract sum is 827*l.* less than the amount allowed in the Local Government Board estimate.

The Walsall Town Council, at their meeting, agreed to accept the tender of Messrs. C. & W. Walker for supplying and erecting at the Pleck Gasworks a set of six cast-iron purifiers, for a sum of 2,040*l.*, and of the tender of Messrs. Clapham Brothers for supplying and erecting at the same works an annular condenser and washer scrubber, for the sums of 520*l.* and 550*l.* respectively; for the Sewage Farm Committee, the tender of Messrs. Goddard, Massey & Warner, for lime-mixers and sluice-gates and frames, at the sum of 144*l.* 10*s.*; and for the Streets Committee, the tenders of Mr. H. Holloway to make Alexandra Street, Spout Lane and Tennyson Street, for 272*l.* 8*s.* 3*d.*, 143*l.* 4*s.* 6*d.* and 125*l.* 19*s.* 10*d.* respectively.

THE firm of Messrs. J. & C. Hay, builders, Dundee, has secured the contract for extensive additions to and alterations on the Burgh School, Kirkcaldy, from plans by Mr. James Gillespie, architect, St. Andrews. The contract for the mason work will amount to between 4,000*l.* and 5,000*l.*

At the meeting of the Wolverhampton Town Council it was resolved that the Lighting Committee should be empowered to advertise for an electrical engineer and an architect, and to give instructions for the preparation of plans and specifications for the construction of all necessary buildings.

ON the occasion of a lecture on the typewriter, recently delivered in Exeter Hall, Mr. H. S. Shultess-Young, barrister, said he had set out originally with a very high ideal in search of a typewriter; but after examining seven or eight of the machines on the market he found it necessary to lower his ideal considerably. Ultimately after careful inquiry and trial he secured a Yost. The Yost was the best, and until something better should take its place he must own himself entirely satisfied with it.

MR. GEORGE STEDMAN, electrical engineer, has removed his works, showrooms and offices to more commodious premises at 69 St. John's Hill, Clapham Junction, S.W.

MESSRS. WINFIELDS LIMITED have secured the important contract for the supply of electric light fittings to the Huddersfield Town Hall.

NO tender has as yet been accepted for the public library proposed to be erected at Poplar; we therefore postpone publishing the list this week.

WE have again pleasure in calling the attention of our readers to the very excellent type-written specifications and bills of quantities prepared by the Anglo-American Association Type-writing Office, at 15 Cockspur Street, S.W. The best proof of their appreciation of the high-class work turned out by the Anglo-American Office is that the many leading metropolitan and country architects, builders and others who patronise them always express their unqualified approval of the neatness and correctness of the work done, and continue their orders.

MESSRS. TOLHURST & SON'S business having greatly increased, they find it necessary to remove their offices to their factory, 1 Bowling Green Lane, Farringdon Road, London, E.C., for facilitating the prompt despatch of orders.

VARIETIES.

It is proposed to construct a deep water dock at Workington, with a view of benefiting the industries of the district.

THE Middleton Town Council proposed to borrow a sum of 42,000*l.* to carry out a sewage scheme prepared by Mr. Hinnell, of Bolton.

It is proposed to build a hospital for infectious diseases at Stratford-on-Avon, the cost of which, exclusive of furnishing, is estimated at 5,000*l*.

AT the meeting of the Society of Arts on Wednesday, the 19th inst., Mr. Gisbert Kapp will read a paper entitled "Some Economic Points in connection with Electricity Supply."

WE have before called attention to the exhibition of the ancient painting *The Wenham Doom*, at St. James's Hall, Piccadilly, which is now open to view.

AT the meeting of the Birkenhead Town Council the plans for the new fever hospital prepared by the Surveyor were approved. The building will cost 20,594*l.*

AT St. Helens it is proposed to raise the necessary funds for building new schools and enlargement of existing schools, to avert the foundation of a School Board.

AT the meeting of the Glasgow Association of Students of the Institution of Civil Engineers, Mr. C. P. Hogg in the chair, Mr. Wm. R. Copland, jun., read a paper on the "Tarapaca Waterworks."

PLANS for building a hospital for treatment of infectious diseases at Tewkesbury have been prepared by Mr. Villar, architect. An inquiry has just been held by the Local Govern-

ment Board into an application by the Rural Sanitary Authority to borrow 3,000*l.* to carry out the work.

THE Carlisle Journal says:—The Earl of Carlisle has, through Mr. C. J. Ferguson, intimated his wish to present to Tullie House a replica of the alto-relievo designed by Mr. Burne-Jones and executed by the late Sir Edgar Boehm, of the Battle of Flodden Field.

IN consequence of the recommendation of the Sanitary Authority, Pennington, Hants, it has become necessary to make some provision for drainage. A committee has therefore been formed to consider the matter, and they have instructed Messrs. Pinder & Fogerty, civil engineers, of Bournemouth, to prepare a scheme for the drainage of the district.

THE Cleansing Committee of the Manchester Corporation advise the purchase of Chat Moss and three farms situate between the Moss and the Manchester Ship Canal, in all about 2,500 acres, as a place for the disposal of nightsoil and refuse from the city, and that application should be made to the Local Government Board for power to borrow 200,000*l.* to carry out the scheme, provide buildings, plant, &c.

WHATEVER may be the fate of the Parish Councils Bill, there is at least an advantage in understanding its provisions. One of the "Local Government Handy Series," published by Mr. Edgcumbe-Rogers, has been assigned to it, and like the others of the series, the clauses are expressed in language which is not beyond the comprehension of rustics. The little books are invaluable to all who take an interest in following the course of local legislation.

AT the meeting of the Leeds City Council the following resolution was unanimously adopted, viz.:—"That two baths be erected at a cost not exceeding 8,000*l.* each, exclusive of land, one on the site in Union Street known as the 'Midden,' and the other on the vacant land near the Viaduct in Kirkstall Road; and that the Baths and Washhouses Committee be reappointed until October 31 next, to carry out all matters in connection with the Baths and Washhouses Act, and to obtain designs for the two baths recommended to be erected."

AT the meeting of the Leicestershire Architectural and Archaeological Society, held at the old Town Hall Library, the Rev. C. Rodwell in the chair, the chairman referred to the loss sustained by the death of the Rev. L. W. Wood, hon. sec. for the Lutterworth district, and it was resolved that a letter of condolence be sent to his widow. A vote of thanks was passed to Sir Henry Dryden for his present of 300 copies of his draw-

ing of the Foxton Cross. The Rev. E. Jackson, of Gilmorton, was elected honorary local secretary for the Lutterworth district.

THE removing of plaster from the east side of the cloister court of Jesus College, Cambridge, has disclosed a row of arches belonging to the thirteenth century. They appear to have formed a portion of the arcading of the cloisters in the convent which stood on this site before the college was founded. The arches, of which three have already been laid bare, are well preserved. They have been filled up with rubbish, and used to make part of the present wall, which dates from the sixteenth century. The bottoms of the pillars are some 5 feet below the level of the present surface of the ground.

ON Thursday, the 30th ult., Mr. Rienzi Walton, C.E., of Westminster, Local Government Board inspector, held an inquiry at the Town Hall, Maidenhead, in regard to the application of the Corporation for permission to borrow 30,000*l.* for drainage and sewage purification works. The Mayor, with the Town Clerk and most of the Council were in attendance. The Great Western Railway Company, large ratepayers, were also represented. Mr. C. Nicholson Lailey, C.E., of Westminster, engineer of the proposed scheme, gave information as to the size and length of the sewers—amounting to about 14 miles—and stated he intended to treat the sewage by the International Company's system of precipitation with ferozone and filtration through polarite beds, having already adopted it, with remarkable results as to efficiency and economy, at several places. Dr. Angell, F.I.C., public analyst and consulting chemist to the International Company, described the chemical aspect of the system, and conclusively showed that there would be no nuisance, and that the effluent would satisfy the Thames Conservancy. The sewage is at the present time disposed of by broad irrigation, but the land treatment has proved unsatisfactory, many complaints having been made by the Thames Conservancy as to the bad effluent coming from the land. The Conservancy at length called upon the authorities to comply with the Rivers Pollution Act, and adopt the best known and available means for purification of the sewage, which the Corporation eventually agreed to do. There was practically no opposition. Mr. Smith, on behalf of the Great Western Railway Company, wished, on sentimental grounds, that the tanks should be put as far from the station as possible, and this will no doubt be done. The site was afterwards visited by the Government inspector, who expressed his satisfaction with the scheme.

Is a thorough Cure for Damp Walls, and is made IN ALL COLOURS and COLOURLESS.

A SILVER MEDAL was awarded at the INTERNATIONAL HEALTH EXHIBITION, 1884, for Excellence and Durability.

The Original Inventors and Sole Manufacturers,

THE GRANITIC PAINT COMPANY,
32 King Street, Cheapside, E.C.

ESTABLISHED 1866.

THE last discussion meeting for the session of the Manchester Association of Engineers has just been held at the Grand Hotel, Aytoun Street, Mr. T. Daniels, president, in the chair. Mr. A. Saxon, read a paper on the best design of main and other bearings. There was no special design of main bearing that would meet all the circumstances and conditions with which engineers were called upon to deal. There was, in fact, no universal bearing that fulfilled all requirements, but out of a number of different designs it was their business to select the most suitable.

At the last quarterly general meeting of the Glasgow Institute of Architects, the president, Mr. W. Forrest Salmon, brought up the following recommendation from the Council of the Institute regarding the proposed by-laws under the Building Regulations Act, 1892, viz. that the Institute withdraw its opposition to the by-laws on the understanding that by-law No. 73 would be struck out, and that it was the intention of the Town Council to prepare in a year or two a Building Act for Glasgow more thorough in character than the existing Acts, and to consult with the Institute when framing the clauses. On the motion of the President the Institute adopted the recommendation.

THE Philatelic Chamber of Horrors, *Bric-à-Brac* says, now open to the public at 281 Strand, from 10 A.M. till dusk, has become the sensation of the philatelic world and the talk of the town. Everybody is talking of it. Stamp-collectors are coming from far and near to see this exhibition, which is simply unique of its kind. There is nothing like it. There can be nothing like it, for Mr. J. W. Palmer has brought together in one room the specimens of counterfeit stamps that he has accumulated in the course of an experience which none other can equal, either in the extent of his operations or the number of years they cover. Anybody can paper a room with stamps, with reprints, or, as they may call them, with remainders. *Bric-à-Brac* asserts confidently that it is impossible for any person in the world to bring together such a collection, numbering nearly 70,000 spurious specimens. "If these postage-stamps were not forged," said Mr. J. W. Palmer, "they would be worth a million sterling." The postage-stamps play the part of wall-paper. They look like an intoxicated mosaic. The room is about 12 feet square, and is in keeping with the exterior of the building, a bit of Old London. The four walls are completely covered with postage-stamps. Such a collection would be curious even if the stamps were not forgeries, for they represent every known stamp in the world.

NOTES ON NOVELTIES.

Windows.—The sliding-window, *i.e.* sashes hung with lines and weights and sliding in a cased frame, is pre-eminently a British institution, and will be found in use wherever the Anglo-Saxon race has established itself. Sliding-sashes possess many distinct advantages over the casement light, whether the latter be made to hang inwards or outwards, more especially on account of their adaptability to through ventilation, and con-

sequently are recommended by sanitarians without an exception. To pull the top sash down an inch and to lift the bottom sash up an inch is at once extremely simple and effective for that purpose. But the ordinary sliding-sash has one serious disadvantage, viz. the difficulty of cleaning the outside of the

glass without risking life and limb. To employ a man (or as is more frequently the case a lad or a girl) to stand or sit on a ledge or sill, generally not more than six inches wide and some 50 feet from the ground, and without any means of holding excepting by the tips of the fingers to the outside linings, causes a dizzy sensation even to the spectator on terra-firma, and is the cause of some eighty fatalities per annum. The danger attending such a method of cleaning windows has long been recognised, and, as is well known, it is a criminal act, punishable with fine and imprisonment, to employ a person to clean a window in the manner above described (10 & 11 Vic. cap. 89). To overcome the difficulties enumerated inventors have been busy during the past half-century, but unfortunately without any material success hitherto, occasioned probably by the enhanced price and the variation in construction. Houghton's patent window, as shown in the illustration, is quite a new innovation, extremely simple, and appears to us to have overcome the difficulties both as to price and construction, and should command an extensive patronage. With the single exception of a joint in each of the stop-beads, both the sashes and the frame are in appearance exactly similar to any ordinary window, *i.e.* there is no diminution of light or addition of wood, but by simply giving two small bolts a quarter-turn a part of the pulley styles together with stop and parting beads, and one or both of the sashes may be pulled or lifted forward into the room, and the outside of the glass cleaned from the floor level. On lowering them into the frame an airtight joint is formed, and the bolts being released the sashes slide again in the ordinary manner. The sashes may be held up for cleaning either with stays or an automatic pulley arrangement. A specialty in this invention is that any old window can be altered without even unhooking the sashes, and the old beads can be reused. The windows are made and supplied by Houghton's Patent Window Company, Battersea Park Road, S.W.

accumulations or unpleasant odours will be found to be entirely removed. It is not liable to be damaged as ordinary lead traps, and should any repairs be required, or the waste-pipe become choked, the parts can be quickly disconnected without the cutting of pipes or making of new joints. It is adapted for use in conjunction with lavatory basins, sinks, baths, &c., and takes up less space than the ordinary lead trap and its arrangements.

THE FURNITURE TRADE EXHIBITION.

THIS interesting exhibition is now in full swing at the Agricultural Hall, and is replete with every variety of furniture. It is to be regretted that a few well-known firms are not represented, but this is compensated for by the large number of exhibitors. The promoters are endeavouring in every way to make it a success, and to interest visitors. One of the most prominent stands is that of Messrs. F. M. Benjamin, No. 34, the most conspicuous feature of which is its varied character, ranging from antique oak to modern requirements. The centre space is occupied by a very handsome sideboard in the rough, 7 feet in width and 11 feet in height, the carving, which is most elaborate, consisting of a design of foliage and flowers. We understand that this specimen has found a purchaser during the exhibition. A very handsome oak bookcase, with cathedral glass, is also well worthy of notice, as much for its moderate price as high-class workmanship. Furniture of the period of Louis XIV. is also well represented, a fine drawing-room suite, elaborately finished, doing the firm credit. Italian cabinets, engraved with copper, bronze and mother-of-pearl, will interest those who admire artistic work, for goods of this description are decidedly uncommon. Chippendale designs, handsomely upholstered, are *en évidence*, and, to complete the variety, dining and drawing-room suites, at a most moderate price. Oak chairs, Italian, French and German, will provide a liberal choice, either to the buyer of plain or artistic furniture. There is not, in fact, a more interesting exhibit, and we have no doubt that Messrs. F. M. Benjamin will not fail to do a good share of business. The showrooms of the firm are at 102, 104 and 106 Leonard Street, Finsbury, E.C., where all the goods are manufactured.

WE have received from Messrs. Wright Sutcliffe & Son, of Halifax, particulars of their new combined overflow, waste and trap, which they say is quite a novelty, there being nothing like it in the market. It is made entirely of brass, and so constructed that the unions can be readily unscrewed and the trap disconnected for cleansing. By this arrangement the trap can be thoroughly cleansed at periodical intervals by disconnecting and plunging into boiling water or other means, when any

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms at their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

Amongst other exhibitors whose names are well known are Messrs. Cumming & Smith, whose specialty is Scotch furniture; Messrs. H. L. Benjamin, with many varieties, including a large display of sideboards, and Messrs. Vaughan & Co.

An interesting exhibit to architects is that of Messrs. S. Ives & Co., who show high-class carved oak goods. A handsome sideboard, of Renaissance pattern, fitted with iron hinges, and skilfully carried out in design, with dinner-waggon to match. The locks correspond in every detail with the antique character of the originals. A cabinet—a reproduction from the Nuremberg Museum—with wrought-iron fittings, and other cabinets, book-cases, chairs, complete a splendid exhibit. It will be quite information to many of our readers to know that they can obtain the reproduction of the most antique articles at a price that would seem small for ordinary goods. Italian, French and German work are shown, so that connoisseurs have unlimited choice.

Messrs. Wright & Hansford exhibit Japanese wall-papers, &c. The Mikado Bamboo Co. have a very conspicuous show of bamboo furniture, with that excellent finish which we generally attribute to Parisian work. The bamboo used is of the best quality, and the designs are very novel. Messrs. R. Bashendorff & Co. also exhibit bamboo goods, and Mr. W. E. Carty, their enterprising representative, explains convincingly how Japanese decorations may be introduced in every style of house.

Mr. Charles Davis has a more imposing display of window blinds than at the Building Exhibition, and a patent ventilating window fastener is also shown. This firm seem to have had a considerable demand for their blinds, cornices, &c., during the week.

Mr. W. Duncan Tucker, the well-known horticultural builder, is represented by a large variety of conservatories, &c., and makes a specialty of his patent anti-dry sash bar, whereby the drip so injurious to the growth of plants is prevented. It can also be made in any size and length to suit any house without altering present construction. Mr. George Kidd, their indefatigable representative, will be glad to explain this feature to visitors.

Amongst many well-known names familiar to visitors at every exhibition of the kind are those of Messrs. Kaye & Sons, Limited, locks, &c.; Mr. Robert Adams, door-springs, &c.; the Braloo Window Company, with their well-known patent safety window, &c. We hope to refer again to the exhibition in a subsequent issue.

PNEUMATIC WOOD-CARVING MACHINE.

A VERY ingenious wood-carving machine is just now being introduced to the public. It is of the utmost simplicity, and should readily find a sale amongst the carved wood and furniture dealers. The machine is the invention of Messrs. Tyler & Ellis, and the patents have recently been purchased by the Pneumatic Wood-Carving Machine Syndicate, Limited, of 1 Gresham Buildings, Basinghall Street, London, E.C. It is attracting great interest, and is being made in a variety of sizes for power and treadle, and a small machine to fix to a bench will shortly be placed on the market. The immense quantity of wood-carving used for furniture and decorative work, now almost entirely cut by hand, which is necessarily a slow and expensive process compared with the work of this machine, will make it a necessity to the trade. It consists of a table or bench supported on light iron frames. These frames are carried at the back into two bracket-like projections, on which are carried a system of swinging arms and levers so arranged as to give a universal parallel motion to the upper frame. This upper frame is constructed of light solid-drawn steel tubes, very rigidly put together, carrying on the front bar or tube a tracer or dummy and a carving tool and motor. The whole of the moving parts are so counterbalanced, that when the tracer is held in the fingers like an ordinary pencil it can be moved over the table in any direction and up and down with perfect freedom and ease.

The parallel gear is so arranged that the tool or cutter is compelled to move through the same distance as the tracer and to always maintain the same relative position to it, so that whatever figure the point of the dummy describes, the point of this tool always describes an exactly similar shape. With this machine any piece of wood-carving may be reproduced with the utmost accuracy and without any skill on the part of the operator. The original carving or pattern, which may be either in wood or metal or even a plaster-cast, is clamped down to the table, while beside it is fixed a piece of wood of the size necessary for the reproduction of the same. The tracer is then moved slowly by hand over the surface of the pattern, while the cutter removes everything that comes in its way, leaving behind it an exact reproduction of the original pattern.

The motor for driving the tool is a most simple and effective piece of mechanism. It consists simply of a spindle running in ball bearings, the lower end of which carries an ordinary drill chuck for holding the tool. Just above this is mounted a

disc carrying fans or vanes similar to those of a centrifugal pump which revolve inside a case. Into this case the air is led through a nozzle, and, striking the vanes, causes the spindle to revolve with an enormous velocity, as many as 30,000 revolutions per minute being sometimes reached.

The reservoir of the bellows is loaded down with springs, so that the pressure on it can be varied according to the quantity of air present. A flexible rubber hose leads from the bellows to the motor, to allow the latter to be moved about with perfect freedom. The motors are made with such accuracy and are so nicely balanced that even at the highest speed there is no apparent vibration, and there being no guts or belts required to drive it, it is perfectly free from any external force; thus there is no resistance to overcome in moving the tracer over the work, except the resistance of the wood to be cut, which is very small, and the inertia of the parts.

The whole machine is of neat design, lightly but strongly made, and, beyond an occasional oiling, requires no skilled attention whatever.

PHOTOGRAPHY.

LAST year Messrs. Perken, Son & Rayment organised a competition for a series of prizes to be awarded for photographs executed with their doublet lenses, and the prints sent in—together with enlargements from the negatives—are now on view at 99 Hatton Garden. The competing photographs are about 350 in number, and range from quarter-plate size to 15 by 12, while the series of enlargements—some of them from quarter-plate to nearly thirty-inch base—are specially good, and show a fineness of detail all over the sheet which we could barely expect in direct pictures. Another competition is, we believe, to be shortly organised. The latest form of the "Rayment" portable camera is a camera with the Kinnear bellows, and fully equipped with aluminium fittings. The half-plate camera focusses out to 18 inches, and all adjustments are rapidly made by the application of the firm's rack-and-pinion arrangement, which is pushed out of gear by a single movement. The doublet lens, which was fitted to the camera when we saw it, is set in aluminium, and is inside the camera, a blind-shutter being on the outside; by this device the lens remains inside the camera when the apparatus is closed for travelling, and adds nothing to the thickness of the package. The ready means of detaching the front of the camera by means of two bolts acting together must be seen to be appreciated. A batch of thirty

clinical thermometers had just been returned from the Kew examination. Out of the thirty no less than sixteen were returned as standard at the four bearing points 95 deg., 100 deg., 105 deg. and 110 deg., while the maximum divergence was two-tenths of a degree, and only four instruments showed this divergence.

THE LATE JOSEPH WILLETT.

THE death took place on Monday, the 10th inst., at the age of ninety-one years, of Mr. Joseph Willett, whose life forms an interesting connecting link with some of the greatest engineering works of the century. Mr. Willett was associated with George Stephenson, Brunel and other well-known railway men and contractors. He was contemporary with the father of the present Lord Brassey, with whom he had business connections of an important character. He took an active part as a contractor in the opening up of the Manchester and Liverpool Railway, the pioneer system of the country, and had especially to do with what were then considered great undertakings at Wigan. He was present at the opening of the railway between this city, says the *Liverpool Courier*, and Manchester, when Mr. Huskisson was killed. Deceased worked directly under the supervision of Stephenson, of whom he used to record many interesting anecdotes. In addition to works on the pioneer line of England, Mr. Willett was also entrusted with large railway contracts in connection with the Birmingham and Rugby, and the Birmingham and Worcester, and the Cardiff and Neath railways. Mr. Willett married a daughter of Pritchard, "the father of tunnels." The deceased gentleman used often to talk to his friends about his early days, and he gave it as his opinion that in the matter of bridge construction Brunel was the superior of George Stephenson. The deceased himself carried out some of the most renowned tunnelling works in the district. Mr. Willett was always a very abstemious man. He was fond of tobacco, and up to Friday last, when he took his last "draw" of the weed, he indulged regularly and pleasurably in the habit. It was a great source of gratification to Mr. Willett in his old age to observe the vast development of railway enterprise since the days when he first made its acquaintance. His wonder and satisfaction often caused a smile to pass over his face when he conjured up the days when a train would stick fast on the line and a horse would have to be hooked on to the carriages to pull them along. He used to relate that an engine which was brought up to Liverpool was found to be too heavy in its make

for the metals, and it was with some difficulty taken off the line and sent away in a canal boat to another system, where it was more likely to be of service. Mr. Willett enjoyed exceptionally good health during his long career, first as a railway contractor, and subsequently as a manufacturer of patent manure.

THE MIDLAND CANALS AND THE BRISTOL CHANNEL.

A CARDIFF correspondent of the *Manchester Guardian* writes:—Eight million tons of traffic are yearly carried over the network of canals comprised in what is generally described as the Birmingham Navigation. Some of it passes over the Shropshire canals to Ellesmere Port, and more will necessarily go that way when the Manchester Ship Canal is completed. A large trade is carried on with Hull also by means of the waterways between Birmingham and the Trent Navigation. There has, however, always been a constant, if slow, communication between the Midland manufacturing districts and Bristol Channel ports by way of Worcester and the Severn river and the Gloucester and Berkeley Canal to Sharpness. This trade is expected to be greatly developed by the deepening and widening of the Severn Navigation. It should, according to the calculation of the Severn Commissioners, receive a new impetus when the river is dredged up to Stourport to an even depth of 10 feet of water, with a bottom depth of 40 feet. But the Birmingham Navigation as it exists to-day places many impediments in the way of rapid water communication between the Bristol Channel and the Midland districts or the further north. There are waterways which would enable Bristol or Cardiff to run steam barges carrying 30 tons of cargo, and taking a cargo-barge in tow, either to Southampton on the one side or Liverpool and Ellesmere Port on the other. In the matter of access to Birmingham, however, an obstacle is raised by a series of thirty locks within a distance of 3 or 4 miles, which means a rise and fall of, roughly speaking, 200 feet from the level of the table-land. This it is proposed to meet by converting the long link of locks into an incline. Such a "lift" as that on the Weaver Navigation near Northwich is in this case out of the question. The proposal of the engineers who have been consulted is to receive the barges, whether propelled by steam or hauled, into a caisson, which shall be drawn by cable moved by hydraulic power up the stiff ascent, the descending vessel being made to help to raise the ascending craft. Mr. J. McGregor, whose name is honourably known in

connection with the improved works of the inland navigation of India, was the most distinguished member of a party of engineers and others who have just examined the Midland Canal ramifications and the Severn between Worcester and Gloucester. Vessels carrying 400 tons will be able to navigate the Severn from the sea to Worcester, instead of the 80-ton boats which have up to now been used for the journey. Mr. McGregor is of opinion that with specially constructed steam barges carrying 30 tons of cargo, and towing one or more barges of similar capacity, it will be possible to make Birmingham in 15 hours or connect with the Manchester Ship Canal in 48 hours. He estimates that ocean-going steamers will be able to steam up the improved Severn to Worcester at the rate of $7\frac{1}{2}$ miles an hour, or with a barge in tow at 6 miles. But until the Birmingham canals are taken in hand and reformed altogether, the rate of progress must at best be limited to 4 miles. Yet, even as things are, with the new boats the time taken for the transport of goods between Worcester and Birmingham will be shortened from 4 days, or sometimes a week, to less than a day and a half.

SUBTERRANEAN COMMUNICATIONS.

THE Philosophical Society's annual lecture in honour of the anniversary of the birth of James Watt was delivered in the lecture-hall of the Watt Museum, Greenock, by Sir Frederick Bramwell, Bart. The subject was "Subterranean Communications." At the outset the lecturer said that he proposed to confine himself to cases where the subterranean communication was for purposes of traffic, as ordinarily understood, and specially to deal with the kind of tunnelling performed with the aid of shields, supplemented or not, as occasion may require, by the employment of compressed air. Leaving the ancient history of the subject to take care of itself, he would go no further back than the Thames tunnel of the elder Brunel, which was commenced on the Rotherhithe side in 1826 and completed in 1843, so far as foot traffic was concerned, in which condition it remained until 1865, when it was acquired by the East London Railway Company, and was now used to afford railway communication between the north and the south of the Thames. This work was undoubtedly, when all the circumstances were considered, a great engineering triumph. The engineer was the victor in this battle. But it was well to know that victories are

not unfrequently disastrous for the conqueror, and in the case of the Thames tunnel the public remembered the years that had been taken in the construction far in excess of the estimate of time, the cost far in excess of the estimate of capital and the fact that, after all, the work was incomplete as regarded the intended purpose of a road communication. It was in 1830 that Lord Cochrane obtained a patent for facilitating excavation, sinking and mining, and the combination of the employment of compressed air with the use of ordinary pumping was many years afterwards carried into effect in sinking the central pier of the Saltash Bridge. But Lord Cochrane not only saw the value of compressed air in the sinking of shafts, but he appreciated that value for the purposes of tunnel driving, in that its pressure against the working face would hold back the water. It is true, however, that Lord Cochrane did not appear to have appreciated a difficulty in using compressed air against a vertical face, and that he believed the use of compressed air would put an end to all trouble, and that no shield would be needed. So far as he knew, no use was made of compressed air, even for shaft-sinking, in England until 1850, when it was resorted to in sinking the caisson for the piers of the new Rochester roadway bridge. As to the provision of means for an inter-metropolitan communication, it was inevitable that as cities increased the ways that were first provided should become inadequate for the purpose and that they should need supplementing, even for the mode of conveyance in vogue at the time of the construction. Moreover, this augmentation of the means of ordinary communication, when made at great cost by the acquisition of valuable property pulled down to widen existing thoroughfares or to admit of the formation of totally new streets, resulted after all in little more than relieving the congestion of traffic, but did not provide the means of quicker transport. Three courses to attain the end were open to the engineer. First, to acquire property as if for a new street and to construct a railway on a viaduct. Second, with the object of saving the expense of the acquisition of property, the following the course of existing roadways by a subterranean line. Third, if the people would put up with it, and if the rights of property were wholly disregarded, the existing roadways might be utilised by the construction of a full-blown New York elevated railway, with the locomotives travelling on the level of the first-floor windows. In Liverpool there had been established an overhead railway, the trial trip of which had just taken place. This railway was an instance of an imitation of an American line, but shorn of

its obnoxious features. It did not interfere with the privacy of dwelling-houses, it did not darken their ground floors, and the traction was electric and not by steam locomotives. There was, on reflection, another course—to acquire property, as if for a railway above ground, but instead of devoting the space to the purposes of a railway only, use the surface for an ordinary street and make below it a subterranean railway. Engineers for the last few years had been turning their attention for inter-metropolitan communication to deep-seated tunnels of small dimensions as compared with the ordinary railway tunnel, and in connection with such construction had reverted, after a lapse of years, to the employment of shields, as projected by Brunel, and used by him and by Barlow. As instancing the improvement by the use of shields with compressed air in carrying out subterranean engineering, Sir Frederick reverted to works of this character in other connections than those inter-metropolitan communications, and said a few words about the Liverpool waterworks pipe tunnel, which runs along a line of 77 miles, of the proposed Blackwall tunnel by the London County Council and other similar works. Of the Govan subway he remarked that the great feature of it was that the vehicular traffic was to be raised and lowered by hydraulic power, a plan in which he had every confidence. The Glasgow district subway was also another instance within their cognisance of the use of shields with compressed air.

RAILWAYS IN IRELAND.

Two great wants of which railway travellers in Ireland have always had to complain, the *Dublin Daily Express* says, are the absence of any satisfactory heating apparatus when the weather is cold, and the utter inadequacy of the light supplied when the shades of night have descended. That a remedy for those two terrible enemies to the comfort of passengers on our railways has at last been found, was rendered manifest to all who were fortunate enough to take part in the trial trip of what may be said, without exaggeration, to be the first well-warmed and properly-lighted passenger train in Ireland. The train, which consisted of half a dozen first, second and third class and composite carriages, left Amiens Street Terminus, Dublin, for a run to Drogheda and back, in the course of which the excellency of the new systems for supplying light and heat was strikingly demonstrated. For a considerable time past the passenger cars on several American railroads have been heated by steam passing from the boiler of the engine into pipes placed

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

PATENTED IN
England,
Belgium,
France,
Germany,
Italy.

PATENTED IN
Austria-
Hungary,
Denmark,
United
States
of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours upon it which has never yet been obtained, and one of the most important advantage in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

I have had some trials made with the **KALLKOLITH** during the past few weeks, the results of which are very satisfactory. The **KALLKOLITH** is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale.
J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.

We are pleased to tell you that the **KALLKOLITH** supplied to us has been fairly tried, and we find that it answers all that you claim for it.

CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—E. STUTTARD, 88 ADELAIDE ROAD, BROCKLEY, LONDON, S.E.

under the seats of the carriages, and so contrived that the heat shall remain a constant quantity, the temperature never rising or falling below what is suitable for the state of the weather. This process—the advantages of which only those who have been alternately scorched and frozen, according to the ever-varying condition of the foot-warmers at present in use, can appreciate—was recently introduced into the United Kingdom by Messrs. Laycock, of Sheffield, and having been adopted by some English companies, has now for the first time been tried in Ireland by the Great Northern Company. Another improvement introduced for the first time into this country in this train was electric light, supplied by the energy arising from the motion of the train. Many of the first and second-class carriages on the Great Northern Railway are fitted with electric lamps lit from electric accumulators placed underneath the floor. The accumulators have always to be recharged by means of a gas-engine, either in Belfast or Dublin. The clumsiness, the cost and the trouble of this method of necessity precludes its adoption on any but a very limited scale. To many it would seem that the motion of the train would have been looked to, in the first instance, as the proper source of energy to supply the light, but probably the absence of regulators to insure a clear, steady current to keep the incandescent burner glowing with the proper intensity compelled the company to fall back on accumulators alone. Now, however, the former difficulties have been overcome, and a beautifully clear steady light can be supplied to all the carriages of a train by its mere motion, and there will never be any necessity to charge accumulators by outside energy, as is done at present. The light is supplied by means of a number of accumulators stored in the guard's van. These are charged by the motion of a shaft, which is connected through a hole in the floor by means of a machine belt with one of the axles or revolving wheels beneath. When the train is in motion the accumulators become charged, and by turning a switch in the guard's van the light is supplied to the whole train. If the speed becomes excessive, the surplus electricity thereby generated is dissipated through several coils of wire which have been arranged for the purpose; and if the speed is very slow or if the train stops the current still continues to be supplied at the proper pressure from the accumulators, which contain electricity enough to last for several hours, so that a bright clear steady light of uniform intensity is constantly maintained, no matter whether the train be moving rapidly, slowly or not at all. If a passenger does not wish to have the

light it can be turned off by a little cock at the burner. Third-class railway passengers in this country have, as a rule, been treated with little consideration, though of late considerable improvement in their condition has been effected on some of our principal lines. It is gratifying, however, to note that this latest improvement in the method of supplying both heat and light is not confined to any special class of passenger, but is common to all. Judged from the result of the trip, the new arrangements for giving heat and light to railway passengers are as near perfection as it is possible to imagine. The run to Drogheda and back, which was carried out in good time, and without the slightest mishap, was thoroughly enjoyed by all those who took part in it, a return being made to Dublin about six o'clock.

YORKSHIRE SANITARY ASSOCIATION.

At the meeting of this Association just held at the offices, Park Square, Leeds, Mr. Charlesworth presiding, the report submitted by the council showed an increase of members during the past year. The number of houses inspected for the first time during the past year was eighty-four, bringing the total number inspected by the Association from its commencement in 1886 to 1,260. The Chairman, in moving the adoption of the report, congratulated the society on the excellent work done by the engineers and executive committee, and also upon the great progress made since its formation. He said it was curious how little progress until lately had been made in house drainage. For many years, although house drainage was required and was carried out, it was no one's special duty to look after it. Of late years, however, a change had come, and he could not help thinking that it was partly due to the action of that society. If they examined the drainage of houses throughout the county they would find a very large proportion were still in a very bad condition, and that meant a serious state of affairs. The question arose, then, were the people to be made solely responsible for the drainage of their houses, or should the burden rest on the sanitary authority? He did not think it would be beneficial if sanitary authorities were made solely responsible, but he thought the landlord and tenant should be made mutually responsible to each other. That applied to houses of the well-to-do; but in the case of the poorer class of property, he thought it important that the sanitary authorities should exercise a control.

ST. HELENS WATERWORKS.

THE new water-softening works belonging to the St. Helens Corporation, which have been erected at Brown Edge, Nut Grove, at a cost of 11,000*l.*, have been formally opened by the mayor, Mr. A. Sinclair. The object of the works is to reduce to a uniform rate of 10 or 12 degrees of hardness the whole of the water supplied to the borough. The water from Eccleston Hill and Whiston already fulfils this condition, but that from Collins Green, which has 22 degrees of hardness, and from Knowsley and Kirby, which have 18 degrees of hardness, will be treated at Brown Edge, and rendered as soft as the other. The new building adjoins the boundary wall of the new Rainhill Asylum. It has been erected by Mr. John Whittaker, of Sutton, and the machinery has been put in by Messrs. Woodhouse & Rawson, of Kidsgrove, the whole of the work being carried out under the superintendence of the water engineer, Mr. D. M. F. Gaskin, and the resident engineer, Mr. E. T. Hildred.

The Mayor, in starting the machinery, said in 1862 the consumption of water was 250,000,000 gallons, whereas in 1891 it was over a thousand million gallons—an increase of fourfold. The removal of the iron from the water was an important matter. His impression was that four new boilers had to be put in at his house owing to the large quantity of iron in the water.

TRADE ARRANGEMENTS.

THE following correspondence has taken place between Mr. Anstey and the secretary of the National Association of Operative Plasterers:—

1 Addington Square, Camberwell Road, S.E. :

November 13, 1892.

Sir,—I think the time has now arrived when I may venture to acknowledge the action of your society in stopping my business. After many years trading as a contractor for plastering work, in and about London, I suddenly find myself bereft of workmen and unable in consequence to undertake any more work for a time, or indeed to complete the contracts which I had in hand, since your society has kindly put the brake on. I may mention that I am grateful to you for one thing, and that is, your kindness in selecting for the period of your attack the slackest time I have known for many years past.

If your act of petty tyranny had taken place at some future

time it would probably have caused me serious loss, and it might also have inconvenienced some of my customers, but as it is I can afford to smile at the truly workmanlike diplomacy which orders the trade to boycott one of its best friends—one who challenges any man in the trade to prove that I have ever done otherwise, throughout my career as a plasterer, than to faithfully uphold the principle of the trade.

However, I now take the liberty of asking you why it is that I am boycotted, and what action it is possible to take to restore me to the favour of your society. I will not ask you for any reason reconcilable with the dictates of common sense, for there can be none.

Do you object to my being an employer of labour? If so, I must ask you to be at least consistent and inform the writer why he is selected, I may say honoured, by your keeping him under your notice for the last few months past.

Now, I am under the impression that my sole offence is that I have taken the unpardonable liberty of rising somewhat above the level of my fellow-workmen in becoming an employer instead of remaining a journeyman. If that is so, I regret sincerely that the great body of otherwise intelligent men for whom you act cannot see further into this particular matter. Awaiting your reply, I have the honour to remain, your obedient servant,

(Signed) HENRY ANSTEY.

The General Secretary, Plasterers' Society.

National Association of Operative Plasterers :

December 12, 1892.

Mr. Anstey,—Dear Sir,—Your letter has been laid before the above committee, who instruct me to inform you that a ballot of the members of the London District of the National Association and the Metropolitan Society, as to whether piece-work plasterers recently struck against be reinstated, has been taken, with the result that 31 voted for reinstatement and 1,973 voted against. Your good-humoured banter could really never have been penned expecting a reply; committee therefore instruct me to be silent respecting it.—I am, yours obediently,

—, Secretary, &c.

1 Addington Square, Camberwell Road, S.E. :

December 28, 1892.

Sir,—I am duly in receipt of your letter of the 12th inst. in answer to mine of the 13th ultimo. I understand therefrom that it is the intention of your committee to prevent all further progress in business on my part, and you give as an argument

HYGIENIC WORKS—
LIVERPOOL.

VENTILATION.

Special Notice to Architects.

Gentlemen,—As a proof of the confidence we place in our GIBBS PATENT WEATHERPROOF AIR EXTRACTORS, we hereby offer to send at our sole risk to any Architect in the United Kingdom (upon being furnished with satisfactory references) one of our ordinary "Extractors" for competition and comparison with other Ventilators by any maker. If ours is not found superior in every respect, the same to be returned (say, within fourteen days) at our risk and cost; if retained to be paid for at usual rates.—Yours Obediently,

JOHN GIBBS & SON,

WARMING, VENTILATING, AND CONSULTING ENGINEERS,
27 SOUTH JOHN STREET, LIVERPOOL.

TELEPHONE—
No. 1,389.

TELEGRAMS—
"VENTILATION, LIVERPOOL"

From the prevailing tendency on the part of unscrupulous advertisers to push the sale of utterly inferior ventilators made of the lightest materials and flimsiest possible construction, we find it advisable to make the foregoing offer. All we desire is fair comparison in quality and price.

for this, and as the only argument, that a ballot has been taken of the members of the London district of the Plasterers' Society, with the result that the reinstatement, as it is imperitantly termed, of piecework plasterers was voted against by an immense majority.

Your letter is a truly pitiable statement—I cannot call it a defence. Because 1,973 plasterers, who have never had the matter fairly placed before them, and consequently could have had but the haziest notion of what they were voting against, declare against the so-called reinstatement, your committee calmly instruct you to write and tell me the result of the ballot, as if the will of your committee was as the laws of the Medes and Persians, and as if that were an end of my business and of me also.

I doubt that very much. It rather proves to my mind that your committee does not seriously consider the immense power they control, or otherwise they would never use the same so tyrannically. What a ponderous machine to set in motion with such a base object in view, viz. to prevent a man from following his legitimate calling, and virtually stealing from him the opportunities of earning an honest livelihood, under the garb of doing away with piecework plasterers.

Now, if this is really your earnest desire, why do you not stop the piecework plasterers who are also members of your society? This is blowing hot and blowing cold with a vengeance. However, this is the kind of petty tyranny which has been dealt out to me by the order of your committee, without the slightest notice or the reason for so doing, and when I venture to ask for a reason you coolly inform me your committee instructs you to be silent in the matter.

Now, I will ask your committee as, I must presume, a reasonable and responsible body of men, is this consistent with the fair trading of which there has been so much talk about on behalf of the members of your society? I think not. To my mind this kind of business savours more of a secret organisation than a body of British workmen banding themselves together in council for their mutual benefit and for the advancement of the honourable craft which they represent. Now, will you kindly note the following remarks, and if you can instil them in the minds of your evidently not very communicative committee I shall be glad. In the first place, I demand an answer to my question, "Why am I boycotted?" Is the reason merely because I am a plastering contractor? I have always paid the full rate of wages, and declined to employ men at rates below the standard. Your committee can therefore have nothing to

say against me on that score. In the second place, you will be good enough to point out to your committee that I do not class myself in the category of piecework plasterers, neither do I see where the banter comes in, unless it be on your own side. In the third place, your committee may make a note of the fact that the power of reinstatement does not lie in their incapable hands, but in the hands of the master builders. Your committee can unjustly boycott, but they have no power to reinstate. Now, I wish to be enlightened on these matters, and therefore I must ask you to be generous enough to answer this letter in detail; I shall then know what further steps to take.—I am, yours truly,

(Signed)

HENRY ANSTEV.

The Secretary, National Association of Operative Plasterers.

Professor Kirkpatrick, referee of the Edinburgh and Leith Masons' Conciliation Board, has issued his award, fixing the wages of the operative masons at 8½d. per hour, as from 15th inst. In note appended he says:—"In the Advocates' Library on March 20 last the case for the master builders, who seek to reduce the present rate of wages by one halfpenny per hour, viz. from 8½d. to 8d., was stated by Mr. John Sutherland, secretary of the Master Builders' Association; and the case for the operatives was stated by Mr. John McCallum. On both sides the case was argued with fairness and ability." After summarising the arguments and evidence submitted on both sides, he concludes with:—"I find it sufficiently proved (1) that the building trade here is in a depressed condition, being slacker than this time last year, and greatly slacker than at any time since the year 1888. (2) That while masons' wages rose to 9d. and 9½d. per hour last summer, and while trade was brisk and masons scarce, as at January 1 last, this apparent revival of prosperity was only temporary. (3) That masons' wages are at present more than ½d. higher in Edinburgh and Leith than the average rate in Scotland, and more than ¾d. higher than the average rate for the whole of Great Britain. These facts lead irresistibly to the conclusion that the present rate of wages must be reduced; but I have reduced the rate by the smallest possible sum, viz. ¼d. per hour, because there is reason to believe that a considerable overflow of work from last year remains to be done, and that part of it at least is of an unusually important character. The operatives of Edinburgh and Leith will still be paid more than the average wages earned by their brethren throughout Great Britain, while the reduction, though slight, will afford the employers relief to the

appreciable extent of about 1s. per week. I have only to add that the parties conducted their respective cases with fairness and moderation, and I have no doubt they will abide loyally by the above decision. It can hardly be expected that either of the parties will view the decision with much satisfaction; but they will, I feel assured, bear in mind that it is the outcome of that beneficent system of conciliation and arbitration which averts the disastrous effects of less civilised methods of settling disputes."

Subsequently a mass meeting of Edinburgh and Leith joiners was held to consider the report and award. After considerable discussion it was agreed to approve the recommendation and accept the referee's decision.

THE SANDGATE LANDSLIP.

At the meeting of the London Geologists' Association, Mr. Wm. Topley read a paper on the subject of "The Sandgate Landslip." He said the geological conditions affecting the landslip were very simple. It was interesting to note that almost the whole of the line of coast from Hythe to Folkestone was a landslip. Sandgate, he said, was entirely built on an old landslip, due to the slipping of the clayey sands of the Sandgate beds, one of the subdivisions of the lower green sand. The recent slip was merely a renewed movement in the old slip. It was due to the great accumulation of water caused by the heavy rainfall of January, and to the fact that no provision had been made for underdraining the area. The eastern part of Sandgate had been drained by a deep land drain carried under the steep hill at the back of the undercliff. West of the town the land was also drained, and the recent slip commenced on the east exactly where the old land drain ends. The Sandgate beds underlie the Folkestone beds, and the explanation of the slips was that the water percolated through the Folkestone beds, soaked down into the Sandgate beds and saturated them, and was such a weight there was always a tendency to slips. In one part of Sandgate there were always slips at this time of the year; but as they did not do much damage not much was heard about them. It was quite a mistake to suppose there were no slips. Several houses had been removed from time to time as insecure because of these landslips. What little shingle came to Sandgate had been washed away, and he thought it was very likely that the taking away of this great amount of weight from the front of the shore had rendered it

somewhat more insecure. A very odd thing was that the landslip commenced, as a serious landslip, exactly at low-water mark on the evening of March 7. About six o'clock the next morning the movement recommenced at the next low spring tide, and it was reasonable to suppose that the want of support in the front of the shore had had something to do with determining the exact point at which the landslip took place. The blowing-up of vessels such as the *Calypso* and the *Benvenue* off the coast would render the ground a little bit insecure; but quite sufficient reasons for the slip were, he believed, to be found in other ways. The saturation of the ground due to heavy rains was a sufficient cause, and for this complete underdraining was the remedy.

BEQUEST TO WORKING-MEN.

A SCHEME for the application of the Proudfoot Bequest of over 20,000*l.* for the benefit of the working-men of Moffat was agreed to on Saturday at a meeting of working-men held in the Proudfoot Institute, Moffat, to consider the scheme proposed by the magistrates, who are trustees of the bequest, for the application of the income of the endowment. Provost Young, who presided, stated that as the bequest had been nearly all realised, the trustees had been, along with a committee of working-men, considering a scheme for the application of the income. Mr. Proudfoot's will only provided for a reading-room and place where temperance refreshments should be sold at cheap rates. As the trustees could not spend the income of the extremely large sum the bequest had unexpectedly amounted to on these things, they proposed to ask the Court of Session to sanction other matters for the benefit of working-men. On the Institute had been spent 1,800*l.* They proposed to enlarge and improve it at a cost of about 2,200*l.*, and to invest 7,000*l.* for its maintenance. They proposed spending 1,000*l.* in laying out a recreation ground and bowling green solely for working-men and their families, and to invest 1,000*l.* for its maintenance. The income of another 1,000*l.* invested would be given to Moffat Cottage Hospital, provided working-men are admitted for treatment free of charge. 3,000*l.* would be invested to provide temporary relief in time of sickness or want of employment or severe weather, to working-men and women who have resided five years in Moffat, and 3,000*l.* would be invested to provide pensions to old working-men or women who are natives of Moffat.

SOCIETY OF ENGINEERS.

AT a meeting of the Society of Engineers held on Monday evening, Mr. William A. McIntosh Valon, J.P., president, in the chair, a paper was read by Mr. H. Conradi on "The Cleaning of Tramway and other Rails."

The author commenced by offering a few remarks with reference to street-cleaning appliances in general, and the conclusion arrived at by him was that they do not tend to keeping tramway rails clean, but rather the reverse. He then referred to the regulations enforced by some local authorities which compel the tramway companies to leave their lines in the muddy and dirty condition engendered by the general street traffic unless mud-collectors were used in combination with the apparatus for clearing the rails. He pointed out that, although the combination of a mud-collector with an ordinary street-sweeping machine had been condemned and abandoned, several local authorities still imposed this combination as a condition on the tramway companies when using rail-cleaning machines. He also showed how prejudicial to both animal and mechanical traction dirty tram rails were, and described several machines devised for effecting their clearance. These inventions, without exception, were of rigid construction, and, therefore, incapable of accommodating themselves to the inequalities of the track. They included the patents of Mr. Green, Messrs. J. & E. Townsend, Messrs. Rayner & Edwards, Mr. Dickinson, Messrs. Record & Jordan, Mr. Prosser and Messrs. Nobes & Jackson. The author then described his rail-cleaning machine, in which the principle of elasticity was introduced for the first time, and was combined with lightness of construction. The first apparatus constructed by him consisted of two tubes, each containing a vertical spring. In each of these main tubes was suspended an internal tube, leaving ample clearance for free play. To each of the inner tubes was fixed a leaf-spring, to which was attached the scraper-point and straight-plate, forming the cleaner. The lifting and lowering gear, carried on a cross-shaft, was worked by a connecting rod and lever from the driver's seat. After a private trial the apparatus was modified by making the scraper-spring a full coil, by making the scraping-steel and the shovel-plate separate and the latter of angular shape, and increasing the size of each. Triangular brushes were also added. The author then proceeded to point out the action of the cleaner, which he said was subjected at one and the same time to four constantly varying

conditions, viz. deviations and irregularities of the permanent way; lateral deviation of engine or car; vertical motion of engine or car, and the forward motion of the car or engine.

Describing the work this contrivance had to perform the author said:—Fine dry dust blown about by the wind, offering no great resistance to traction, should be removed by this apparatus only after the water-carts of the town have sprinkled the road and laid the dust. In other words, this apparatus should not be brought into use for dry dust, but be employed for dust only when the same has been slightly moistened by water. Mud, soft, sticky or greasy slush and snow are all readily removed by this contrivance. Mud which has been hammered in by the wheel flanges and has become very hard requires the scraper-points to run over it several times to cut it and then to remove it. In this case the scraper-points act like a pick, vibrating up and down, unless it is cut. For still harder mud or ice stronger springs have to be used. Obstacles wedged in, removable only by a chisel and a hammer, are not intended to be cleared by this apparatus, which is only constructed in accordance with the power available for tractive purposes. By means of the elasticity of the coil-spring, as also the given transverse motion of the shaft or the scrapers, the cleaner readily follows curves or an irregularity of the permanent way, and passes easily over joints, crossings, points, &c. A practical proof of this is afforded by its application to four cars at Reading which have now been working over eighteen months. It has also been fixed to other companies' electrical, cable and horse cars.

He then described several experiments made during the running of the cars, by which it was shown that the tractional resistance met with by a car running on rails cleaned by the previous car was from 25 to 30 lbs. less than when running on dirty rails. Not cleaning the rails, he said, was the cause of rapid deterioration either of horses or of any description of mechanical power used for traction, as well as of the rolling-stock, a fact generally known and admitted by engineers, managers and in some cases by the directors themselves. It was therefore difficult to understand why so little is done in this direction, and the cleaning of the rails so completely neglected. Horses or mechanical power and rolling-stock are permitted to run to destruction rather than provision be made for the proper cleaning of the permanent way. As electricity is rapidly coming forward for tractional purposes, and is specially cited as the cheapest method, the author maintained that for electrical traction clean rails are of the utmost importance,

effecting, according to Mr. A. Reckenzaun's experiments, a saving of 15 to 50 per cent. of tractive power. This saving applies, of course, also to all kinds of traction. He compared the cost of various systems of cleaning, arriving at the following results:—By hand once a day, 1s. per mile of single line in the fine season, and 2s. per mile in the severe season. Watering by cart twice a day, 2s. 6d. per mile. By the author's rail cleaner, as often as required, 6d. per day.

THE Architect and Contract Reporter.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

NOTES ON NOVELTIES.

The "Sireon," the sole patentee and manufacturer of which is Mr. Milton Syer, of 36 Rye Lane, Peckham, is a combination of closet-pan, metal spreader, metal arm and two-gallon syphon cistern. The silent syphon cistern and closet-pan combination of metal arm and spreader with flush-tank. Perfect water waste-preventer, silent action, water-closet pan perfectly cleaned, force of flush directed where most required, trap cleared at every discharge, entirely new principle, no putty joints, no earthenware arm to break off by frost or flushing-rim to contract or warp in the kiln, and thus cause bad flush. This is a common fault with present system; hardly two closets flush alike. With this invention a perfect and regular flush is obtained with every closet. Each closet can be used with a right or left hand supply or straight, as the inlet arm is made bent and has a screw cap to fix in any position. No rubber joint, but arm is soldered to lead pipe, making a perfect and lasting connection, without any contraction of water-way.

TRADE NOTES.

THE well-known Grinnell sprinkler fire-extinguishing system has been lately fitted up in The Poplars, Avenue Road, Regent's Park, the private dwelling-house of Mr. Ludwig Mond. Mr. Mond being particularly anxious to have his house made as secure from fire as possible decided to adopt sprinkler protection, and he gave Messrs. Dowson, Taylor & Co. carte blanche to fit their Grinnell system in the most "risky" portions of the premises. As the interior decorations of The Poplars are of a rich and tasteful description, it was of course necessary to fix the pipes for the supply of the sprinklers in such a manner as not to cause disfigurement. This has been done, and the pipes and sprinklers carried along the ceilings have been decorated and give a not displeasing effect. In the upstairs portions of the house, to which the system may ultimately be extended, it is proposed to fix the pipes underneath the floors, and drop the sprinklers through the ceiling at intervals, in the same manner as adopted at Mr. William Whiteley's premises, Westbourne Grove. There the sprinklers are fixed in the centre of an ornamental rose-leaf, giving a pleasing effect to the ceilings of the various rooms. Grinnell sprinklers until lately have been only sought after for the protection of manufacturing risks, but they are now being adopted for the fire-protection of other descriptions of property, such as public buildings, theatres and private mansions.

MESSRS. LAING, WHARTON & DOWN, of 82A New Bond Street, W., have just received the contracts for electrical installations, or other electrical work, at the following places:—The business premises of Messrs. Mathias & Strickland, 23 Princes Street, Cavendish Square; additions at 34 Hyde Park Square; the premises of Mr. C. J. Phillips, 1 Eaton Square; the residence of Mr. G. Peck, 25 Chesham Place; the business premises of Mr. R. Douglas, 21 and 23 New Bond Street; the premises of Messrs. Henry Poole & Co., Savile Row.

NEW works are to be erected for the Dunfermline Gas Light Company, some of the contracts for which have been accepted at a cost of about 20,000*l*.

THE Hove Commissioners have accepted the tenders of Messrs. John Freeman, Sons & Co. to supply 1,800 feet of granite curbing at 1*s*. 5½*d*. per foot, and 1,800 feet of granite channelling at 1*s*. 3*d*. per foot; also to accept the tender of the Imperial Stone Company to supply 600 yards of artificial stone paving slabs at 5*s*. 3*d*. per yard.

FOR WIRING AND ARTISTIC FITTINGS.

WORKS: KILBURN.

Cases for Binding the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

THE Streets and Buildings Committee of the Edinburgh Town Council have accepted estimates of footway and carriage-way repairs for the year ending May 15, 1894, amounting to over 10,000/.

It is proposed to obtain a faculty for erecting a chancel screen in Bromsgrove parish church. A sketch design has been submitted by Messrs. Jones & Willis.

THE Brighton Board of Guardians have accepted a tender of Messrs. Comyn Ching & Co., of London, for the erection of an improved steam cooking apparatus, capable of supplying 1,500 people, at the Brighton workhouse.

IN the advertisement for tenders for town improvements at Swansea which appeared in our last issue there was an error in the name of the architects. Tenders should be sent to Messrs. J. P. Jones & Rowlands, 58 Wind Street, Swansea, not later than the 26th inst.

THE hospital in connection with the East Poorhouse, Dundee, is being fitted throughout with heating steam cooking apparatus and laundry machinery by Messrs. Harper Twelves-trees, engineers, London and Manchester.

THE firm of White, Allom & Co., of 8 Mount Street, W., decorators and collectors of antiques for the artistic treatment of house interiors, have just secured an important contract for furnishing the new Town Hall at Richmond. The firm apparently have peculiar opportunities for carrying out good work on very reasonable terms.

VARIETIES.

AN inquiry has been held by the Local Government Board into the application of the Manchester Corporation for power to borrow 100,000/ for purposes connected with the collection, deposit and disposal of the refuse of the city. It was stated that the money was required for the completion of works at Carrington Moss, and for the provision of destructors, &c., at the various depôts in connection with the work of the cleansing committee.

AT Gorton an inquiry was held with reference to an application by the Gorton Local Board for powers to borrow the sum of 30,000/ for the purpose of constructing sewage works. It is proposed to treat the sewage by a system of chemical precipitation, subsequently passing it through filter-beds. The Manchester Corporation opposed the scheme.

AN inquiry has been held at the offices of the Swinton and Pendlebury Local Board into the application of that Board for sanction to borrow 1,443/ for works of sewerage. It was explained that the Board proposed to construct a main sewer from Chorley Road, Swinton, to Dale's Brow, by way of Worsley Road, to relieve the sewer in Chorley Road during heavy falls of rain.

THE Water Committee of the Carlisle Town Council have received a report from Mr. James Mansergh, the consulting engineer, with reference to a supply of water for the city by gravitation, in which he estimates the cost of the work at 210,000/.

AT the monthly meeting of the Yarmouth Port and Haven Commissioners it was decided, by advice of the engineer, Mr. Matthews, that the South Pier should be repaired, at a cost of 5,600/. A sum not exceeding 2,500/ is to be expended this year, and the whole work is to be completed within two years, in conformity with the recommendation of the late Sir John Coode.

A CLAIM made by the Greenock U.P. Church congregation for 1,000/ against the Caledonian Railway Company, for damages alleged to have been caused to the church by the tunnelling of Newton Street, has been submitted to Mr. W. R. Copland for arbitration.

AT the ninth general meeting of the Glasgow Association of Students of the Civil Engineers, just held, Mr. W. R. Copland, president, in the chair, Mr. James Young, jun., Stud. Inst.C.E., read a paper on "Underpinning in connection with the Central Railway Works." The following office-bearers for the coming year were elected as follows:—President, Mr. George Graham, M.Inst.C.E.; vice-presidents, Messrs. J. E. Harrison, John Cowan, and D. A. Matheson, Assoc.M.M.Inst.C.E.; hon. secretary, Mr. W. R. Copland, jun., Stud.Inst.C.E.; council, Messrs. Easton, B.Sc., Gale Venters, B.Sc., and Wilson, Stud.Inst.C.E.

THE Denbigh Town Council propose to borrow 4,500/ for the erection of a Smithfield Market.

AN interesting collection of fine old brass work from Thibe and Nepal, just received, is on view at Messrs. Howell & James's, Regent Street, Pall Mall, consisting of panas, hanging lamps, secundra, vases, incense-burners, water-bottles, gods and goddesses, indras, procession lamps, ink-pots and pen cases, tea-pots, bells, &c.

ELECTRICAL.

THE introduction of electric light into Crieff is contemplated. An electrical engineer has lately visited Crieff and examined the water-power available, with the result, it is stated, that he considers that for an outlay of about 3,000*l.* an installation of about 600 lamps of 16 candle-power each can be secured, and if accumulators are used an additional outlay of about 2,000*l.* will be required; but in that case 2,000 lamps of 16 candle-power each would be obtained. It is reported that a splendid waterfall, ample for all purposes, may be placed at the disposal of the town if the scheme is gone into.

AT the meeting of the Worcester Watch Committee the electric-lighting question was again under discussion. Plans and estimates for the proposed buildings at the generating station at Powick were received and discussed in detail, and it was decided to recommend the City Council to apply to the Local Government Board for the loan of an additional sum of not exceeding 9,000*l.* for the purpose, repayable in thirty years. It was stated that the total expense of the installation of the electric light was inclusive of this estimate.

IN Edinburgh the Lord Provost's Committee approved of a sub-committee's report recommending that the Corporation should themselves undertake the carrying out of the powers conferred upon them under their electric lighting order. A memorial against the Town Council working the electric light order themselves has been largely signed by the Princes Street and other shopkeepers.

THE Gas Committee of the Carlisle Town Council have passed a resolution to the effect that, while keeping the matter under careful consideration with a view to taking action when desirable, they are of opinion that the time has not arrived for taking steps with respect to electric lighting.

BUILDING AND BUILDERS.

AT the meeting of the Derbyshire County Council a report recommending the erection of county offices at an approximate cost of about 15,000*l.* was adopted. The Council also sanctioned the expenditure of 24,000*l.* for the enlargement of the lunatic asylum.

THE *Leeds Mercury* says:—A month ago attention was drawn to the fact that the Building Clauses Committee had had before them and passed upwards of a hundred plans for buildings it was proposed to erect in the city. The members of this committee have had another busy day, when they passed a further batch of ninety-five plans.

THE Halifax Board of Guardians are negotiating for the purchase of about nine acres of land at Skircoat Green for the erection thereon of a new Workhouse Infirmary.

A COMMITTEE has been formed to raise money on behalf of the building fund of the Radcliffe Infirmary Buildings, Oxford.

A CHURCH is about to be built at Cogan on a site adjoining the main road to Penarth, given by Lord Windsor, who has also generously given 500*l.* towards its erection. Mr. J. S. Corbett, Mr. T. R. Thompson, and Miss Olive Talbot have also promised substantial subscriptions. The total outlay, including fencing of site, will be about 2,500*l.*, about 1,750*l.* of which has been promised. The contract has been let to Mr. W. Richards, contractor, Barry, and an excellent design in the Perpendicular style has been prepared by the architects, Messrs. Kempson & Fowler, Llandaff. It is hoped that the work will be completed by December next.

THE foundation-stone of a new Primitive Methodist Chapel, at Donaldson's Lodge, near Cornhill-on-Tweed, has been laid by Mr. F. D. Blake, of Tillmouth, who generously gave the site. The contractors for the building are Messrs. Elliot & Son, Berwick-on-Tweed, and they are carrying it out under the superintendence of the architect, Mr. George Reavell, jun., of Alnwick.

WORLD'S FAIR COIN.

THERE is considerable speculation as to how great a premium will be asked for the World's Fair souvenir coins when the issue is exhausted. It is generally known that a subsidy or grant of 2½ million dollars (2,500,000 dols.) was made by the United States Government to the World's Fair, and that it was decided that this donation should be made in the shape of

5,000,000 souvenir half-dollar coins. Early last autumn, when it was announced by the managers of the Columbian exhibition that bids would be received for the disposition of the first souvenir half-dollar coined at the Philadelphia Mint, a well-known New York firm, desiring to contribute somewhat to the success of the great industrial enterprise, quietly submitted its offer of 10,000 dols. for the first perfect coin struck by the die. The bid being in excess of anything offered, New York receives this valuable and interesting souvenir, and the proprietors of the Remington Typewriting Company are to be credited, on New York's behalf, with this evidence of public spirit. This is believed to be the highest bid ever paid for any coin, modern or antique. Of the first lot of 10,000 of these half-dollars minted in Philadelphia, four were reserved as prize coins; the first, now the property of the firm just mentioned, the four hundredth as indicating the anniversary period now being celebrated, the number 1492 signifying the date of the discovery of America by Columbus, and number 1892 being that of the present year, or four hundredth anniversary. Columbus did not announce his great discovery to Isabella by means of lightning passing in a current through wires laid on the bed of the Atlantic Ocean, and then sit down and confirm his cable despatch of that date with a letter dictated to the operator of a typewriting machine. It was not until 1867 that the Remington Standard Typewriter was invented. In 1874 the Remington machine was first put upon the market. There are now in use in different parts of the world about 150,000 of the Remington Standard Typewriters.

THE MARSDEN TILE COMPANY.

THIS company has succeeded in producing beautiful tilework, as may be seen by works already carried out by them in London buildings, and also by inspection of samples of their work at their premises, 37 Walbrook, E.C. There is a large scope for beautiful work in tiles, where pictures, landscape effects, &c., are the aim, and this field has been widely worked with great success owing to the beauty of the pictures and work. The tilework of the Marsden Company, which we lately made a close inspection of as carried out by them, certainly deserves to carry off the palm for tilework, as it depends only on good design and colour properly applied for success. It may seem that we are over critical, but in this class of decorative tilework we have thought the weak point has too frequently been in the colouring.

Mr. G. W. Marsden, the managing director of the company, is, we understand, responsible for the colouring, and also for the designs, though architects' designs are also worked out to perfection. It would take too long to do more than allude to one or two points. Architects, artists, &c., will soon, if they see the work, be able to judge that Mr. Marsden is a master in the treatment of colour and all the various effects of contrast and blending that produce a wonderful harmony to delight the eye with beauty and restfulness. From first to last there is nothing discordant, the varied colouring of long corridors form one pleasing whole. The colours are deftly blended. Bright colour is not gaudy, but takes a natural place in a general scheme. Toned colours are not insipid or dead, but appear to brighten up the work in proper correspondence to the rest. Anyone interested in the use of tilework for decoration will find it worth their time to look at the corridors and staircases at Thanet House, 61 and 62 Gracechurch Street, E.C. The whole of these are carried out by the Marsden Tile Company, for Mr. H. H. Collins, architect. The dado work, in richly coloured majolica work, is beautifully designed in different colours, with honeysuckle pattern, the frieze above being an admirable reproduction of the architect's design. The filling above this to ceiling is, in colour, a beautiful light sage green, of alternate embossed and plain tiles, producing a very fine effect by this simple arrangement. The building has been thus tiled interiorly from top to bottom, and the length of corridors and height of staircase show off the beauty of the work to the full. The same character of work is carried out in the lavatories. A pleasing departure from the usual routine of printed notice-boards on the walls has been devised. Small panels enclosed in rich mouldings are used as indication-tablets, the lettering being executed in the Marsden decoration. In the whole of this work a little examination will be necessary to understand how the effective whole has been produced by delicacy of shading and of blending, and by other details that one is only accustomed to look for from among old masters or living artists, fully understand the mysteries of colour, and how to apply it. Other works carried out by the Marsden Tile Company are at New Broad Street House, E.C., Messrs. Davis & Emanuel, architects; 36 Essex Street, Strand, for Messrs. Hesketh & Stokes, architects, who since instructed the company to carry out the work also at 37 and 39 Essex Street. The work is more than creditable to so young a company, and in addition they have turned out not only artistic work, but work that is

original, so that an observant eye is at once struck by seeing something out of the common. Aiming at this too frequently results in disaster. In carrying out extensive works there is a difficulty in keeping the tints exact. But nothing of this sort is perceptible in the Marsden tile work, however large the superficial area to be covered. We should mention that Mr. A. Wellesley Smith is the London representative of the company, 37 Walbrook, E.C.

THE LONDON COUNTY COUNCIL.

DISAPPOINTED in their expectation of being able to dictate to the Imperial Parliament what its duty is in the matter of such trifles as "unearned increment" and the great principle of "betterment," the London County Council at their meeting, the *Standard* says, resolved to withdraw the provisions relative to certain schemes included in their Improvements Bill, thereby bringing the outlay, originally estimated at more than five millions and a quarter, down to less than one million.

After criticising the schemes of the London County Council for raising money and consequent abandonment of improvements, the *Standard* adds:—But what kind of finance and what kind of common sense does all this exhibit? The Council rate is going up, and will continue to do so, yet improvements declared to be needful are arrested for lack of money. The plain truth is that the policy of the London County Council has plunged the finances of the Metropolis into confusion. There was a time when Thames Embankments could be built, when a costly scheme of main drainage could be accomplished, when such a thoroughfare as Queen Victoria Street could be laid out and other great works executed. The rates were not so heavy then as they are now, and yet all sorts of miserable schemes are being devised in order to delude the existing ratepayer into the notion that somehow he is being "relieved," whereas he finds that the process is rather the other way. The principle of "betterment" lurks in the present Bill, clearly based, as it is, on some "new rate, duty, charge or contribution," by which the Council want to be rescued from the financial quagmire into which they are daily sinking. The magnificent promises made when the Coal Duty was so confidently abandoned have not averted the inevitable result—that either improvements must cease or rates must rise. The case is even worse, for the rates rise and the improvements are

withheld. But what else can we expect from a London County Council of whose members no small proportion are men without experience, without ballast, without property and without one single qualification for the adequate and responsible discharge of the duties laid upon them?

CARVED FRUIT STONES IN CHINA.

IN China nothing is wasted. The stones of various fruits and the shells of nuts are cleaned, dried and carved into ornaments of the most graceful kind. Among the stones used are the olive, plum, peach and cherry, and of the shells the walnut and cocoanut. The stones are collected with care; each must exceed a certain standard of size, proportion, hardness and weight. They are dried slowly and at such a heat as not to crack or sprout, and are then ready for the carver. The designer makes a rough outline of the future group or picture, and hands it over to his boys or apprentices. These work with great rapidity, and soon block out the design, cutting through the hard ligneous tissue, and then extract the kernel. A second treatment now takes place to dry the interior of the stone, as well as to prevent the fine lining of the interior from undergoing decomposition. This completed, the designer sketches a second outline, and also indicates by his pencil or brush where the surface is to be manipulated, made into leaf-work or arabesque, or be cut altogether away. The work is performed by the subordinates, as at first. The designer then does the finishing touches, after which the assistants clean, polish and oil or wax the perfected carving. The stones are sold in this shape to quite a large extent, but more largely in other forms. Among these may be mentioned buttons, watch-charms, sleeve-links, earrings and brooches, and, when strung together, bracelets, anklets, necklaces, watch-chains, rosaries and official ornaments. The price of a stone varies greatly with the workmanship and the fame of the carver. Some may be bought as low as 5d. apiece, others command as high as 8s. and 12s. each. The average price is 1s. 3d. a stone, with a handsome discount for purchases in quantity. The carvings display great variety and beauty. One class represents bunches of flowers and leaves, in which pistils, stamens and tendrils are accurately executed. Similar to these are fruits and flowers, and flowers and leaves. A second class is composed of carvings of birds, reptiles and higher animals. The dragon, griffin, stork, horse,

lion, tiger, camel, elephant and bull are the favourite figures. A canon in Chinese carving is to reproduce only those animals which have been deified, and those mentioned are about the only ones which have enjoyed divine honours. A third class, and by far the most interesting, comprises groups of human figures representing scenes in history, poetry, mythology and the drama. The workmanship is often so fine as to be microscopic in its delicacy. In fact, the finishing touches are made by the artist while using a magnifying glass of at least fifty diameters. On stones not over an inch in length along their major axis, it is not uncommon to find eight, nine and ten characters in different attitudes and costumes. Unlike most phases of Chinese art, there is much regard paid to perspective and foreshortening. Some of these pieces might have been made by Hindoo or Italian artists, so free are they from local conventionalism. Nevertheless, in the main, conventionalism is all-prevailing.

AN AMERICAN RESERVOIR DAM.

At the meeting of the American Society of Civil Engineers on the 5th inst., Mr. Walter McCulloh read a paper on the new Sodom Dam of the Croton Waterworks, in which he explained the use of wire cables as part of a contractor's plant.

The reservoir consists of two basins, joined by a 10-foot circular tunnel 2,000 feet long, through which the water passes from the basin which has the larger watershed into the Bog Brook basin, which has only $3\frac{1}{2}$ square miles of watershed, with a storage capacity nearly as great as the former, which drains 73.42 square miles. The combined storage capacity obtained in this manner is 9,500,000,000 gallons. Sodom Dam, which impounds the water in the larger basin, is of masonry throughout, and the Bog Brook Dam is of earth only. The Sodom Dam spans a gorge, and is 500 feet long at the coping line, which is 78 feet above the river bed.

Examinations at the site were made by test pits and borings in 1886. The dam crosses the valley at right angles to the stream, which here flows to the north, and at the site adopted the hill to the east showed an outcrop of hard gneiss rising abruptly 30 feet above water, with boulders and gravel at its foot. The rock back from this rose about 40 feet in 100, and was covered with a few feet of soil. The slopes on the west side were 15 per cent. at water surface, diminishing to 5 per cent. at top of dam; and the rock, which was from 4 to 10 feet

below the surface, was decomposed and shaly for a depth of about 15 feet. The rock in the river bed was solid, and was overlaid by a light deposit of sand and gravel. The ridge to the east, below the site of the dam, was parallel to the river and about 75 feet above it, and a dam of earth 600 feet long was constructed upon it to the height of the masonry dam, and at the north end of this earth dam is the spillway dam, which is a masonry wall 8 feet high and 500 feet long, with the lip 10 feet below the top of coping of the Sodom Dam and 6 feet below the flood line. After passing this the waste-water follows through an old water-course in a channel cut to the rock and between curved retaining walls.

The greatest height of the dam (above rock) is 98 feet, the thickness at bottom is 53 feet, and under the coping 12 feet. The total batter on the lower face is 37 feet, decreasing from 9.3 in 10 to 2.7 in 10. The batter on the back is 10 per cent. up to 38 feet below the top, and plumb above that point. The gatehouse is 37 by 42 feet, and rises 23 feet above the dam near the centre. This discharge is through two 48-inch pipes, which pass through the body of the dam. The work was begun February 22, 1888, and completed and accepted October 31, 1892, nearly three years after the date fixed by the contract.

The floods in the stream rise suddenly, and the discharge in a spring freshet reaches 250,000 cubic feet per minute. To control this during construction, a timber crib-dam was thrown across the river about 80 feet above the site of the work, and a canal cut 26 feet wide and 15 feet deep on the west side and around the work to a point 500 feet below. The gatehouse and eastern half of the dam were then built to about 25 feet above the discharge pipes, and in the dry season of 1889 the water was turned through the pipes and the other half of the dam started.

In preparing the foundation all loose rock was removed by dynamite, and afterward all loose seams or shakes by blasting with black powder and barring out. The foundation was swept with wire stable-brooms and washed clean. All pockets or holes were then filled with rich Portland cement concrete. A tighter bond it was found could be made with rubble consisting of small stones than with concrete beds. Water entered through several seams in the rock and would wash the mortar out of the concrete, but it could be led around the rubble beds until finally a small well 2 feet in diameter and 1 foot deep was formed at the point where the water boiled up. After the mortar had set the well was baled out and filled quickly with dry mortar, on top of this a bed of stiff wet mortar was laid

and capped by a large rubble stone. After the first 6 feet of the rubble foundation had been placed there was no further trouble.

The dam for about 40 feet of its height is of rubble masonry laid in Portland cement mortar mixed 2 to 1. Above this there was facing stone, 30 inches deep, laid in 2 to 1 Portland cement mortar, backed with rubble in mostly 2 to 1 mortar. The rubble stones varied from a cubic foot to a cubic yard in bulk, and were laid in full beds of mortar. There were no through horizontal joints. Joints were filled with mortar, into which as many stone spalls were forced as was possible. All stone was washed before using. Sand and cement were mixed dry, and then wet only when required. All cement passed through a sieve of 10,000 meshes, and was carefully tested. All loamy sand was rejected. The face stone was a light bluish-grey limestone, cut rectangular, with rock face. Stretchers were 3 to 6 feet long by 30 inches wide, and headers 4 feet long. The thickness of courses diminished from the bottom up. The beds were at right angles to the face, and the stone had to be held in place with wooden blocks and wedges, to prevent slipping until the mortar had set, after which the blocking was removed and spaces left were filled with rubble. The dimension-stone was brought by rail from Wilmington, Del.

Stone-setting was done by the use of the cable, the traveller and derricks. The cable consisted of a $2\frac{1}{2}$ -inch steel-wire cable, stretched over and parallel to the dam, and over towers 67 feet apart, and anchored in the bedrock. On this a trolley ran which was worked by a double-drum reversible engine. A load of 10 tons would sag the cable 25 feet with a clearance of 5 feet above the coping. Most of the excavation was removed, and all material delivered on the wall in this manner. The cost of the cable erected was 3,750 dols. The first cable after fifteen months' use parted without warning, under a load of 6 tons, the break, in the author's opinion, being probably due to unequal wear at the point where stone and cement were hoisted. The towers were then raised 10 feet so as to lessen the tension, and a new cable supplied which lasted until the completion of the work. When the wall had reached a point 31 feet below the top, the standing derricks were replaced by a travelling derrick, mounted on a 30-foot trestle and running on a track of 36 feet gauge; a boom 55 feet long was used with this derrick.

The most serious flood occurred in November 1889, when 3·8 inches of rain fell in eighteen hours, and 8·7 inches during the month. In eight hours after the rain had ceased, the

water rose to 10 feet behind the dam, and in twelve hours to 15 feet, and poured over the top of the dam, although both 48-inch pipes were discharging to their full capacity. No serious damage followed, as part of the dam over the channel was kept 4 to 5 feet lower than the balance of the wall.

The final estimate for the dam and appurtenances was 436,499 dols. The lowest bid received at the letting was 366,990 dols.; the highest, 583,315 dols., and the engineers', 540,030 dols. The difference between bid and estimate was due to modifications in the plans.

The dam is watertight. With 68 feet of water behind it, no leaks whatever have been found, either through or under the wall, or around the ends. Sweating at the joints appears at points, but not so much as to cause a trickle, but it cannot be seen on a dry day. This very desirable result is due to the excellent materials used, the care in preparing the foundation, thorough cleaning of all stone, care in mixing mortar, breaking of joints horizontally and vertically, and close attention by the engineers to every detail. In addition to this the desire on the part of the contractors to do good work, and the existence of a proper relationship between them and the engineers were factors. The contractors were Messrs. Sullivan, Rider & Dougherty.

HAMMERING v. COGGING.

A CORRESPONDENT of the *Glasgow Herald* writes:—A very interesting discussion was ventilated at the shareholders' meeting of A. & J. Stewart & Clydesdale, Limited, as to whether hammering or coggling is the best process of preparing steel for plate purposes. Two well-known and prominent manufacturers were quoted, giving it as their opinion and experience that hammering had its advantages. It must be admitted that hammering, in the meantime, is absolutely necessary for forgings; but for plates—ship, boiler or bridge—steel is prepared by coggling and rolling, not only to give satisfaction to the designer or builder's requirements, but to command their implicit confidence in the coggled material and the practical test results. Take Lloyd's, Board of Trade or Admiralty requirements, and by hammering an ordinary piece of steel beyond certain conditions it will bring about rejection. As an instance, an ordinary piece of steel hammered out till it is practically forged would stand a most satisfactory bend and elongation test, but would exceed the maximum tensile tonnage,

and therefore be summarily rejected. A similar result would affect ship, boiler and bridge steel, as the elongation and tensile tonnage have slight, distinct, but important variations. One important factor in the manufacture of steel is this. When the metal is run in the ingot mould it must be free, to a certain extent, from impurities, and contain a proportion of carbon, according to the conditions and results it is intended to stand. This is the true chemical and practicable condition by which good or highest quality of steel is produced. The steel ingots must possess a due proportion of certain elements (which it is not necessary to specify here); if not, all the hammering that can be bestowed is futile and useless. Commencing with an ordinary quality of steel for plates, it is generally cast in moulds as near the size of the slabs desired as it is possible to work them. In the case where a large slab is required—when the ingot is laid on the anvil—it is often wider than the anvil, thus causing one-half of the blow from the hammer face to affect only one-half of the width of the ingot, and then with suspended hand-levers the other half is moved sideways on to the anvil. In this way it is flattened down and drawn out before it is edged, and, to put it plainly, the edging is only, and has never been much more, than a closing and squaring of the sides under the hammer. To edge one of these large pieces under a hammer is accomplished by putting a square hook on the piece of steel, with a short chain attached, and then, fastened to a projecting key in the hammer "tup," it is turned on edge with the rising of the hammer, and then requires great skill and unity of action on the part of the lever-men to manipulate it. But the effect of hammering an oblong flat surface has its drawbacks, because it is impossible to have an ingot free from hot scale, and every blow being struck and being received on a flat surface drives the scale into the skin of the steel. It must be borne in mind that slabbing means a succession of blows on the same spot to reduce and draw out the ingot before edging. Suppose the scale on the top surface is carefully removed, the surface next to the anvil receives blow after blow without an opportunity of removing it. Again, hammering is a quick, sudden shock, or an act of concussion, and its first effects are at the two points, where it is struck and the solid resistance. The result is that by hammering a large piece of steel is subjected to superficial effect first, before the heart of the steel is in the slightest affected. Forging is not to be confounded with slabbing for reasons it is unnecessary to touch upon meantime. Briefly stated, the conditions and effects of the latest improved cogging are:—A large steel ingot is handled without danger and

laborious skill; the steel is passed between two revolving forces, which are firmly fixed and cannot give way, and which give a uniform impression or compression on the full width of the piece of steel at the same time. The convex formed on the sides proves conclusively that the internal parts of the steel are being obviously affected; then, when the steel is edged, this convexity comes more prominently into contact with the compressive forces, and bears with it greater density to the heart of the steel. Then the revolving forces are circular; this breaks, lifts and carries off the scale from both surfaces. Every pass is presenting a clean surface for further compression, and this is the true art of improving the tenacity and ductility by the cogging and rolling process. Cogged steel for ship, boiler or bridge work as plates, bars or section can be produced of a more natural equality, through and through, than hammered steel, and is more easily worked and with less probability of fracture in the punching and bending of the builder to which the steel has to be subjected. Steel cogged from the ingots into plates or even rivet-bars can be made, and is made, to stand the bending strain, the tenacity and the stiffness to a degree more satisfactory and with less risk of creating a serious want of uniformity. Cogging has enabled the British manufacturer, and will still further enable him, to increase his output and to be satisfied with smaller profits. It shows him ready and willing to march with the times, and, what is more important still, to keep at bay the ruinous and foreign competitor.

LICENSED VICTUALLERS' ASYLUM.

A MARBLE tablet has been recently unveiled in the chapel of this institution, Old Kent Road, to the memory of the Rev. William George Martin, M.A., the first chaplain, who officiated there from the time of its erection in 1850 to the date of his death, April 9, 1892. The choral service was conducted by the Rev. W. H. W. Casely, the present chaplain, and the tablet was unveiled by Mr. John Coveney, the chairman of the Asylum. The memorial consists of a white statuary marble panel, 2 feet 6 inches by 2 feet, enclosed in ornamental framing of same material, supported on marble brackets, caps and bases, and Siena marble shafts, and four brackets over same, the whole surmounted by a pediment enclosing a carved tympanum consisting of a circular garter or ribbon and shield and scroll-work; on the shield is the monogram of the

deceased, "W. G. M.," the total dimensions being 6 feet by 4 feet. The inscription on the panel runs:—"To the memory of the Rev. William George Martin, M.A., of St. John's College, Cambridge, who faithfully officiated as chaplain to the Licensed Victuallers' Asylum from the opening of the chapel in 1850 until his decease. Born February 18, 1820; died April 9, 1892. This tablet is erected by supporters of this institution as a tribute to his Christian worth." The cost of the tablet was 60*l.*, exclusive of the inscription. The whole was executed very admirably by Messrs. H. W. Wilkins & Sons, monumental sculptors, of Pentonville Hill, from designs by Mr. W. F. Potter, architect to the institution, in Classic Renaissance style, to harmonise with the chapel and Asylum. At the conclusion of the service the company attended in the large board-room, when an oil-portrait, life-size, of the deceased chaplain, by Mr. W. Goodfellow, of 179 Regent Street, W., was also unveiled.

PUBLIC WORKS, VENICE.

THE following particulars are given in a report by Consul-General Sir D. Colnaghi, Florence:—

The long and narrow island which goes from north to south as far as Malamocco Harbour is called Lido. Pietro Giustiniano states that there were there two high towers older than Venice, which the Venetian writer Bernardo alleges to have seen with his own eyes, on one of which was engraved the following inscription:—

Adhuc stantem vidit etas nostra
Antiquissimam altitudinis eximie.

In 1053 the monastery and church of San Nicolo were constructed by order of the republic in which to place the remains of St. Nicholas, which are stated to have been brought to Venice from Myra on December 6, 1098.

The first record, now extant, of the port of Lido is a description of the departure in 998, on Ascension Day, of the Venetian fleet, commanded by the Doge Pietro Orseolo the Second, who subsequently defeated the Dalmatians and established the supremacy of Venice in the Adriatic. The Doge was honoured with the title of Duke of Dalmatia, and from that time forward the famous ceremony of the betrothal of the sea was celebrated every year on Ascension Day in the port of Lido. In 1202 the Pope, Innocent III., having proclaimed a new crusade against the Turks, an army consisting of 40,000 men, French and Flemish, arrived at Venice and camped at Lido.

About the end of the same year the Venetian fleet, under the command of the Doge Enrico Dandolo, consisting of 240 ships of war, 70 transport ships, 50 galleys and about 150 "palandre," left the Lido Port, with the troops on board, bound for the conquest of Constantinople. It is evident from the departure of such a powerful fleet that the Lido Port was at that time deep, wide and of easy ingress and egress. But in subsequent centuries the conditions of the port changed, as a decree was issued by the republic permitting ships to throw their ballast overboard before entering the Lido Port, in order to pass through it the more easily. In 1359, 1390 and 1391 vigorous attempts were made to deepen the port by means of barges and men and by making the mouth of the river Brenta flow into the port. In 1402, 1,000 men were employed to excavate a bank which had formed near the entrance of the harbour. But all the efforts were of no avail, as in 1541 only small craft could go out of the Lido Port. Gradually, however, the port was naturally deepened, and during the last period of the republic the galleys found easy entrance and exit through the Lido waters.

The works for reopening the Lido Port began, as may be seen from previous reports, several years ago. The construction of the north-east breakwater, which starts from the point of Treporti, was commenced in 1882. It is to be of the length to its extreme limit of 3,450 metres, of which 2,900 have already been constructed. The building of the south-west breakwater, which starts from the port of Lido, began in the month of March 1889. It is to be of the length of 2,850 metres, of which 1,450 metres have been completed. The two breakwaters jut out to sea, forming at their extremity a mouth 900 metres wide. The construction of the portions under water is of ashlar blocks of Istrian stone and "pietra Euganea," or stone from the hills in the province of Padua, while the upper parts are composed of large artificial blocks of pounded stone, lime and "pozzuolana" framed on the spot. About 1,500 metres distant from the seashore there is a bar running parallel to it. Owing to the construction of the breakwaters a channel was cut by the current through the bar about 5 metres deep at low tide and of a variable breadth from 100 metres to 250 metres. Two gas conical buoys have been moored at sea opposite the breakwaters to mark their extreme limits. The buoy marking the north-east mole exhibits a fixed red light of the range of 9 kiloms. (5½ miles). The buoy marking the south-west pier exhibits a fixed green light of the range of 7 kiloms. (4½ miles). Fort San Nicolo Light has been discontinued, and

the white bell buoy, previously marking the extremity of the north-east breakwater, has been withdrawn.

Although the works will not probably be completed before the year 1895, it is confidently expected that next year the Lido Port will be rendered navigable for the largest vessels. Two large Italian merchant steamers and an English steamship have already gone out of the Lido Port at high tide in charge of pilots. The estimate of the expenditure to be incurred when the works are finished is 6,000,000 fr. (240,000*l.*), but it is expected that a much larger amount will ultimately be laid out by the Italian Government. This important undertaking is carried on under the immediate direction of the eminent engineers Chevalier Carlo Perosini and Chevalier Cesare Spadon. All the Italian and foreign engineers who have visited the new port have expressed their approval of the high ability and success with which the works have so far been carried out.

The works for lengthening the principal quays, and the construction of new stores and other general improvements in the maritime station, have been continued most satisfactorily during the year. There is now sufficient accommodation for steamships discharging their cargoes alongside the moles in railway trucks. Two hydraulic steam cranes of a power of 20,000 kilos. (44,092 lbs. avoirdupois) and 12,000 kilos. (26,455 lbs. avoirdupois) respectively, with a cradle for lifting loaded railway waggons from off the rails, were erected in the month of December, 1891, and are now in operation. The quays have been supplied with 12 cranes running on rails, each of 1,500 kilos. (3,307 lbs. avoirdupois) lifting power, for loading and discharging heavy goods, and in addition there are now some small movable cranes in operation on the quay of the railway station for lifting goods from barges alongside the quay. In conclusion, the maritime station is now supplied with steam hydraulic cranes of great power, sheds, warehouses, railways, running close alongside the ships, and with every modern appliance necessary for a large shipping trade, and has become a dock of the first order.

It is a great security for the health of Venice that the water of the river Brenta, which was the source of supply of the town, has been abandoned. Owing to the river bringing down sewage and refuse matter the water was pronounced unfit for drinking purposes. The water now supplied to Venice through the aqueduct is derived from the springs of St. Ambrogio near Treviso, is conveyed to Venice from the mainland in a conduit placed under the lagoon, and is then distributed, to private houses and public wells, through underground pipes. Before the

year 1884 Venice was watered partly by the water of the Brenta, conveyed to the city in open barges, and partly by rain-water collected from the house roofs, in the "pozzi" or Venetian wells, where it was purified and drawn for use. The difficulty of obtaining drinking water at Venice, since time immemorial, made the Venetians very careful in the construction of their wells. It may not prove uninteresting in England to know how a Venetian well is constructed. It consists of a basin more or less wide, according to the conditions of the place, closed all round and at the bottom by a stratum of baked clay, which is placed on a slab of stone (piatto) laid on the clay. The pipe is constructed of circular bricks (pozzali) joined together with cement of pure clay and sand, to render them permeable, so that the water may pass through them into the pipe from the surrounding basin. The basin is then filled with marine sand to be taken from the dunes, and not with river sand which putrefies easily. The salt sand can be easily purified by frequently putting sweet water into the well and taking it out until all the sand is well washed and purified of its salt ingredients. In the inner part of the basin and all round the pipe are constructed the reservoirs (cassoni), in which rain water is collected through exterior perforated slab stones (sigilli). These reservoirs are also made of baked bricks joined together, like those of the pipe, with pure clay and sand to allow the water with which they are filled to percolate. They are covered with large plates of stone or vaults. One of the greatest difficulties in the construction of such a well is the selection of suitable clay. The quality of clay used here is obtained from the neighbouring moors. The clay must be worked in such a manner as to be rendered a soft mass without any heterogeneous substance, and laid on the subsoil with all possible care and skill. Even here, where all the wells are constructed in this way, few workmen are fitted for the work, and only special workmen are constantly employed. From the proper or improper moulding and laying of the clay depend the success or failure of a well. With regard to the St. Ambrogio water now distributed at Venice, it is most satisfactory to state that it is of a high degree of purity, needs no filtration, is cool in summer, and is entirely approved by all consumers. The municipality and the engineer, Chevalier Filippo Lavezzari, who represents the owners of the waterworks, deserve the greatest credit for the prompt solution of a question which was of paramount importance to Venice.

THE HULL TRADES' UNION CONSPIRACY.

THE defendants in *Temperton v. Russell* and others having appealed against the verdict given against them at the Leeds Assizes, their case was heard before the Master of the Rolls and Lords Justices Lopes and A. L. Smith on Friday and Monday. The action was brought by a builder in Hull against the defendants, who were officers of certain trades' unions having branches there, to recover damages against them for injury caused to his trade by the defendants conspiring together to induce workmen to leave the employment of a number of builders who had entered into contracts with him for the supply of material unless those contracts were broken. The result was that in many instances the contracts were broken, and the plaintiff lost a part of his business. The case was tried at Leeds before Mr. Justice Collins and a special jury in March last, when a verdict was found for the plaintiff with 250% damages. The defendants now applied for judgment or for a new trial.

Mr. Robson, Q.C., on the part of the defendants, submitted that their action was perfectly legal. There was no evidence to show that the object of the defendants was to procure a specific breach of any particular contract.

The Master of the Rolls: The question was whether there was any evidence from which the jury might properly have inferred such an intention, whether the defendants used means to carry out their rules which went beyond the law.

Mr. Robson submitted that there was no evidence to support the inference that the defendants had intended to force the master builders to break their existing contracts with the plaintiff, and yet this special jury at Leeds had found a verdict for him for 250%.

The Master of the Rolls: A common jury would have found a similar verdict.

Mr. Robson thought that even a mixed jury would not have arrived at such a finding.

The Master of the Rolls: Why not? Do you think that a common jury would have been led by their prejudices to have found a dishonest verdict? In my experience common juries have always acted honestly in the teeth of their prejudices when their duty was clearly pointed out to them.

Mr. Robson said that even in the present case he believed that the jury had acted honestly, but he thought that they were mistaken in the conclusion at which they had arrived.

Mr. Tindal Atkinson followed on the same side on behalf of certain defendants.

Mr. Lawson Walton, on behalf of the plaintiff, said that this case had arisen out of a conspiracy that had been going on for a long time in Hull for the purpose of compelling the submission of certain building firms to the rules of the trade unions. The plaintiff was the brother of a member of one of these firms, and as he had declined to obey the order of the trade union that he was not to supply his brother's firm with building materials he had been signalled out to be blocked.

The Master of the Rolls: You mean to say that he was to be punished because he would not refuse to supply his brother with goods?

Mr. Walton said that was so.

The Court dismissed the application.

The Master of the Rolls said that he proposed first to state what he considered were the facts of the case according to the evidence, and then to state what was the law applicable thereto. The first thing to be noticed was the formation of the trade unions in the building trades in Hull. There were three trade unions in connection with the three trades which made up the building trade in Hull. The members agreed to form a union and to subscribe certain moneys, and, in consideration of each member so agreeing with the others, they all agreed to submit themselves to certain liabilities. Each member was to receive certain benefits, and agreed that if he did not comply with certain conditions he should forfeit those benefits. One of the main conditions was that, if a member was called upon to do certain things and refused to obey the orders given by those in authority, he would be expelled from the union, and would lose all benefits. That was probably the constitution of all trade unions, but, at any rate, the evidence here showed it to be the case of those trade unions. That being the case of the three unions, they decided that certain things should be observed by builders in Hull, and that, if persons did not conform to what they thought was good for their trade, they would take action through their members. The unions formed a joint committee, which was to be the authority to determine what the individual members of each of the three trade unions should do, and therefore the joint committee was the agent of each of the three trade unions to act for them, and the joint committee delegated their authority, as they had a right to do, to Russell to act for them in the present case. Russell, therefore, became the agent of each union, and he was the person to direct the workmen to do or not to do certain acts. The joint com-

mittee passed rule 9, and determined to insist upon compliance with it, and, as regards the members of the unions, they had a perfect right so to insist. They had no right, however, to insist upon anyone outside the unions complying with the rule or yielding obedience to it. It appeared that a firm named Myers & Temperton exercised their undoubted right to carry on their business in Hull as they pleased, and they carried on their business in a way not consistent with rule 9. The unions and the joint committee objected to this, and resolved to coerce Myers & Temperton to carry on their business in accordance with the rule, and they attempted to do so, and failed. They then thought that they could coerce Myers & Temperton by coercing other people who dealt with Myers & Temperton, and accordingly they tried to make the plaintiff, among others, refuse to deal with the firm. The plaintiff answered, as Myers & Temperton had already answered, that he was not bound by rule 9 and that he intended to carry on his business in his own way, and he refused to cease dealing with his brother's firm. The committee and the unions thereupon began to coerce the plaintiff into refusing to deal with Myers & Temperton. They tried to coerce him in the same way as they tried to coerce Myers & Temperton, by saying that, if any persons in this trade dealt with the plaintiff, their men would refuse to work for them upon any goods supplied for the plaintiff, and they thought thereby to coerce the plaintiff into submitting to their rule. The business result of that would be that the plaintiff's business would come to an end. They began accordingly to act upon persons dealing with the plaintiff, among others, with Brentano and Gibson. Russell, who was acting for the unions and the committee, knew that Brentano had entered into contracts with the plaintiff, and that he would enter into other contracts with him. Russell, knowing that, let Brentano know that if he dealt with the plaintiff he would come to harm in his business by reason of his workmen being called out. The words used by Russell to Brentano, coupled with the resolution of the committee, which was made known to Brentano, had for their object the preventing Brentano from carrying out his contract with the plaintiff, not for the purpose of injuring Brentano, but for the purpose of injuring the plaintiff in his business, and thus to force the plaintiff to agree to their rule. It was said that this was not an order to the workmen, but only a piece of advice to them, and that they could do as they liked. It was impossible to say that that was so. These workmen had agreed to obey, and if they did not do, so they would be expelled from the

union or fined, or both. It was an order, and an order which the workmen had undertaken to obey. It was an order by the delegate Russell that, if Brentano did the work for the plaintiff under his contract, his workmen were to leave, and in consequence his business and that of the plaintiff would be injured. The defendants therefore acted so as to force the plaintiff to obey them, and if he did not his business would be ruined, and they so acted with intent to injure him in his business. There was ample evidence that all the defendants authorised what was done by Russell. So also with regard to Gibson the same thing happened as with Brentano. The defendants dealt with Brentano and Gibson in order to injure the plaintiff, and as Russell was stated in evidence to have said (though Russell denied this) to "bring him to his knees," and to impose upon him a policy which they had no right to impose upon him. Those were the facts. What was the law applicable to them? The law was indeed hardly disputed, the great stress being to show that the facts did not make the defendants liable. The case of *Bowen v. Hall* showed that no distinction existed between the case of master and servant and other cases. This Court affirmed the judgments of the majority of the Court in *Lumley v. Gye*, and stated that merely to persuade a person to break his contract might not be wrongful in law or fact, but "if the persuasion be used for the indirect purpose of injuring the plaintiff or of benefiting the defendant at the expense of the plaintiff, it is a malicious act which is in law and in fact a wrong act, and therefore a wrongful act, and therefore an actionable act if injury ensues from it." That exactly applied to this case. The next question was whether there was any real distinction between forcing a person to break an existing contract and forcing a person not to enter into a contract. He could see no distinction whatever between the two. There was the same wrongful intent, wrongful because malicious. It had the same effect of injuring the person. The decision in *Gregory v. Duke of Brunswick* seemed to him to be an authority for showing that where persons combined together to do an act so as to injure a person an action might lie, though it would not be so if the act were done by one person. In *Mogul Steamship Company v. McGregor, Gow & Co.*, the House of Lords did not draw any distinction between the two. No doubt there was a difference between an indictment and an action. In an indictment the proof of the conspiracy was enough; in an action, damage to the plaintiff must also be proved. The jury here, upon the true construction of their verdict, found damage to the plaintiff,

and then the judgment of Lord Bramwell in the Mogul case showed that the agreement to do the act was unlawful, and the damage made it actionable. That judgment seemed to show that an agreement to do an act, which if done by an individual would not be wrongful, if damage was caused thereby to an individual might be actionable. It would not be actionable if done by one, but the agreement made it actionable. That doctrine applied to contracts already made and to contracts not yet made. In the present case there was evidence that persons were prevented from entering into contracts with the plaintiff, and that damage was done to the plaintiff thereby. There was, therefore evidence upon both counts to go to the jury, there was no misdirection, and the verdict of the jury was the only one they could have given consistently with common sense. The application must therefore be dismissed.

Lord Justice Lopes said the broad principle was that if a man induced one of two parties to a contract to break the contract, intending to injure the other or to gain a benefit for himself at the expense of the other, that person committed an actionable wrong. A contract conferred upon the parties to it certain rights, and it imposed upon all the world the duty of respecting that contractual tie. That being the law, there was abundant evidence to support the finding of the jury upon the first question. As regards the second question the jury intended to answer it fully in the plaintiff's favour. Was it an actionable wrong? In his opinion it was. The law was that a combination by two or more persons not to deal with a particular individual or not to enter into a contract with him, if done with intent to injure him, and if he was thereby injured, was an actionable wrong. There was evidence in this case to show that individuals were induced by the defendants not to enter into contracts with the plaintiff, and that the plaintiff was thereby injured. The verdict and judgment must therefore stand.

Lord Justice A. L. Smith said he did not think that an ordinary strike, which, since the Trade Union Act, 1871, was legal, was at all analogous to the present case. The present was a very different case to merely calling out men. There was evidence in this case—first, that the defendants intended to coerce Myers & Temperton to obey their edicts, and to bring this about they determined to cut off from them the supply of all materials they might require for their trade, and also the supply of men; secondly, that inasmuch as the plaintiff would not fall in with their edicts, the defendants then determined to cripple and injure him in his trade by inducing Brentano (together with others who were under contract with him) to

break his contract, which they well knew he had with the plaintiff, so that by these means the plaintiff might be coerced into obedience; and thirdly, that the defendants did induce Brentano to break his contract to the loss and injury of the plaintiff. Upon the first cause of action it was impossible to hold that there was not sufficient evidence to support the verdict of the jury, and in his opinion that verdict was right. As regards the second cause of action, namely, the conspiracy, the direction of the learned judge was right, and there was evidence to support the finding of the jury.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

6794. William Wagstaffe, for "Improvements in construction of chimney-pots and ventilators."

6807. Thomas Limond, for "Improvements in lock furniture, rack pulleys and sash fasteners."

6846. James Neil, for "A new or improved door sneck or lock."

6893. Thomas Butterworth Wright, Henry Wright and John Wright, for "An improved washer-plug for taps, valves and the like, used for regulating the flow of water or other fluids."

6972. Edmund H. Lunken, for "Improvements in straight-way valves."

6991. Henry Lawson Hopkins, for "The pentagram improvements in stoves."

7034. George William Melvin, for "Improvements in fire escapes."

7090. James Arthur Thomlinson, for "Improvements in fireproof floors and ceiling."

7148. Charles Hepworth and Robert Robson, for "Improvements in fire-grates for domestic and other such-like purposes."

7155. Daniel Keith, for "Improvements in and relating to window-sash frames."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

WITHOUT KITCHEN FIRE, HOT WATER INSTANTLY, NIGHT OR DAY.

Boiling Water in a Minute. Warm Bath when Wanted.

"THE SALISBURY."

An arrangement of Bath and Geyser,
to stand complete, without Mahogany
Casing.

EWART'S LIGHTNING GEYSER,
